# Contents

<b>I.1 Preface</b>	<b>15</b>
I.1.0.1 Citing GCAT	17
<b>I Introduction</b>	<b>19</b>
I.0.1 GCAT Release History	21
<b>I.1 I. Definitions and Conventions</b>	<b>23</b>
I.1.1 Time Representations and Vague Date Format	23
I.1.1.1 Time Scales	23
I.1.1.2 Julian Date	23
I.1.1.3 Vague Date Format	24
I.1.2 Space and Orbit	25
I.1.2.1 Where Does Space Begin? 80 km!	25
I.1.2.2 Orbit	26
I.1.3 Orbital Parameters and Coordinate Frames	26
I.1.3.1 Perigee and Apogee	26
I.1.3.2 The Friends of Perigee and Apogee	27
I.1.3.3 Coordinate Frames and Units	28
I.1.4 JCAT Identifiers	28
I.1.4.1 Extended JCAT identifier	29
I.1.5 Launch Designations and Piece Designations	29
I.1.5.1 The COSPAR designation	30
I.1.5.2 The Harvard designation	31
I.1.5.3 JSR scheme	32
I.1.5.4 Unknown objects	33
I.1.6 SatType scheme	33
I.1.6.1 Byte 1 (Coarse type)	34
I.1.6.2 Byte 2 (Type modifier)	34
I.1.6.3 Byte 3 (Attach flag)	35
I.1.6.4 Byte 4 (subtype flag)	36
I.1.6.5 Byte 5 (orbit flag)	36
I.1.6.6 Byte 6 (human spaceflight/special group flag)	37
I.1.6.7 Byte 7 (UN registration flag)	37
I.1.6.8 Byte 8 (Failure flag/Constellation status flag)	38
I.1.6.9 Byte 9 (ID flag)	38
I.1.6.10 Byte 10 (Annotation flag)	39
I.1.6.11 Byte 11 (Group control flag)	39
I.1.7 Phases and Status Values	39
I.1.7.1 Phases	40
I.1.8 Launch Success Fractions	43
I.1.9 Orbital Categories	44
I.1.10 Uncataloged ('U') Launches	45
I.1.10.1 The U designation	45
I.1.11 Analyst Objects	48

I.1.11.1	Analyst Objects in the Space Force Catalog . . . . .	48
I.1.11.2	Objects in the CurrentCat . . . . .	49
I.1.11.3	Tentative Identifications of Analyst Objects . . . . .	49
I.1.12	Nomenclature codes (work in progress) . . . . .	49
I.1.12.1	NomCodes file . . . . .	50
I.1.12.2	NomCodes in object catalog AltNames field . . . . .	50
I.1.13	Launch Service Codes . . . . .	50
I.1.14	Launch Profile Codes . . . . .	51
<b>II</b>	<b>Space Organizations</b>	<b>53</b>
<b>II.1</b>	<b>The Space Organizations Catalog</b>	<b>55</b>
II.1.1	Introduction . . . . .	55
II.1.2	The Org Code . . . . .	56
II.1.2.1	Allowed characters . . . . .	56
II.1.2.2	Code and UCode: Organization phases . . . . .	56
II.1.3	The Database . . . . .	57
II.1.3.1	Column details . . . . .	58
II.1.3.2	Sources . . . . .	61
<b>III</b>	<b>Launch Sites</b>	<b>63</b>
<b>III.1</b>	<b>The Space Launch Origins Catalog</b>	<b>65</b>
III.1.1	Introduction . . . . .	65
III.1.1.1	Launch Origin . . . . .	65
III.1.1.2	Launch Sites database . . . . .	66
III.1.1.3	Launch Points database . . . . .	68
<b>IV</b>	<b>Launch Platforms</b>	<b>69</b>
<b>IV.1</b>	<b>Platforms</b>	<b>71</b>
IV.1.1	Platform data structure . . . . .	71
IV.1.2	Catalog of platforms . . . . .	72
IV.1.3	Soviet Oceanographic Vessels . . . . .	72
IV.1.3.1	Passat . . . . .	75
IV.1.3.2	Musson . . . . .	80
IV.1.3.3	Volna . . . . .	85
IV.1.3.4	Priliv . . . . .	90
IV.1.3.5	Viktor Bugaev . . . . .	95
IV.1.3.6	Georgiy Ushakov . . . . .	100
IV.1.3.7	Ernst Krenkel' . . . . .	106
IV.1.3.8	Yu. M. Shokal'skiy . . . . .	114
IV.1.3.9	A. I. Voeykov . . . . .	126
IV.1.3.10	Akademik Shirshov . . . . .	136
IV.1.3.11	Professor Vize . . . . .	151
IV.1.3.12	Professor Zubov . . . . .	157
IV.1.3.13	Akademik Korolev . . . . .	165
IV.1.4	US Rocket Launch Research Vessels . . . . .	178
IV.1.4.1	USS Atka . . . . .	181
IV.1.4.2	USS Glacier . . . . .	185
IV.1.4.3	USS Staten Island . . . . .	189
IV.1.4.4	USS Eastwind . . . . .	191
IV.1.4.5	USS Norton Sound . . . . .	195
IV.1.4.6	USS Ashland . . . . .	199

IV.1.4.7	USS Rushmore . . . . .	203
IV.1.4.8	USS Colonial . . . . .	207
IV.1.4.9	USS Plymouth Rock . . . . .	211
IV.1.4.10	USS Point Defiance . . . . .	215
IV.1.4.11	USNS Croatan, Wallops Mobile Range Facility . . . . .	219
IV.1.4.12	USNS Range Recoverer . . . . .	224
IV.1.4.13	USNS Wheeling . . . . .	228
IV.1.4.14	USAS American Mariner . . . . .	232
IV.1.5	US Missile Test Launch Vessels . . . . .	235
IV.1.5.1	USS Midway . . . . .	237
IV.1.5.2	USS Hazelwood . . . . .	239
IV.1.5.3	USS Kyes . . . . .	241
IV.1.5.4	USS Shelton . . . . .	243
IV.1.5.5	USS Warrington . . . . .	245
IV.1.5.6	USNS Observation Island . . . . .	249
IV.1.5.7	Unknown US Terrier missile ship . . . . .	251
IV.1.5.8	US Army Mobile Launch Platform . . . . .	253
IV.1.6	US Aegis Missile Ships . . . . .	255
IV.1.6.1	USS Richmond K. Turner . . . . .	259
IV.1.6.2	USS Jouett . . . . .	261
IV.1.6.3	USS Shiloh . . . . .	263
IV.1.6.4	USS Lake Erie . . . . .	265
IV.1.6.5	USS Arleigh Burke . . . . .	267
IV.1.6.6	USS John Paul Jones . . . . .	269
IV.1.6.7	USS Paul Hamilton . . . . .	271
IV.1.6.8	USS Fitzgerald . . . . .	273
IV.1.6.9	USS Carney . . . . .	275
IV.1.6.10	USS Benfold . . . . .	277
IV.1.6.11	USS The Sullivans . . . . .	279
IV.1.6.12	USS Hopper . . . . .	281
IV.1.6.13	USS Ross . . . . .	283
IV.1.6.14	USS Decatur . . . . .	285
IV.1.6.15	USS McFaul . . . . .	287
IV.1.6.16	USS Donald Cook . . . . .	289
IV.1.6.17	USS O’Kane . . . . .	291
IV.1.6.18	USS Roosevelt . . . . .	293
IV.1.6.19	USS McCampbell . . . . .	295
IV.1.6.20	USS Preble . . . . .	297
IV.1.6.21	USS John Finn . . . . .	299
IV.1.6.22	USS Ralph Johnson . . . . .	301
IV.1.6.23	USS Paul Ignatius . . . . .	303
IV.1.6.24	USS Daniel Inouye . . . . .	305
IV.1.6.25	USS Carl Levin . . . . .	307
IV.1.6.26	JS Kongo . . . . .	309
IV.1.6.27	JS Kirishima . . . . .	311
IV.1.6.28	JS Myoko . . . . .	313
IV.1.6.29	JS Chokai . . . . .	315
IV.1.6.30	JS Atago . . . . .	317
IV.1.6.31	JS Ashigara . . . . .	319
IV.1.6.32	JS Maya . . . . .	319
IV.1.6.33	JS Haguro . . . . .	321
IV.1.6.34	Unknown Aegis ship . . . . .	323
IV.1.7	Indian Navy Missile Ships . . . . .	325
IV.1.7.1	INS Subhadra . . . . .	327
IV.1.7.2	INS Suvarna . . . . .	329
IV.1.7.3	INS Rajput . . . . .	331

IV.1.8	Other Rocket Launching Ships . . . . .	333
IV.1.8.1	Tai Rui CCOCOOO 37101 CZ-11 launch barge . . . . .	335
IV.1.8.2	Debo-3 launch barge . . . . .	337
IV.1.8.3	DEFU 15002 launch barge . . . . .	340
IV.1.8.4	Bo Run Jiu Zhou . . . . .	342
IV.1.8.5	Dongfeng Hangtiangang . . . . .	344
IV.1.8.6	Unknown Israeli ship . . . . .	346
IV.1.8.7	Sirius barge, Anhueng . . . . .	348
IV.1.8.8	Sea Launch Odyssey . . . . .	350
IV.1.8.9	Once In A Lifetime . . . . .	352
IV.1.9	Soviet Missile Submarines - Project 611 . . . . .	354
IV.1.9.1	B-62 submarine . . . . .	356
IV.1.9.2	B-67 submarine . . . . .	358
IV.1.9.3	B-73 submarine . . . . .	360
IV.1.9.4	B-78 Murmanski Komsomolets submarine . . . . .	360
IV.1.9.5	B-79 submarine . . . . .	360
IV.1.9.6	B-89 submarine . . . . .	360
IV.1.9.7	Unknown Zulu V class submarine . . . . .	360
IV.1.10	Soviet Missile Submarines - Project 613D4 . . . . .	362
IV.1.10.1	S-229 Submarine . . . . .	364
IV.1.11	Soviet Missile Submarines - Project 629 . . . . .	366
IV.1.11.1	Unknown 629 (Golf) submarine . . . . .	368
IV.1.11.2	K-61 Submarine . . . . .	370
IV.1.11.3	K-83 Submarine . . . . .	370
IV.1.11.4	K-102 Submarine . . . . .	370
IV.1.11.5	K-107 Submarine . . . . .	370
IV.1.11.6	K-110 Submarine . . . . .	370
IV.1.11.7	K-113 Submarine . . . . .	370
IV.1.11.8	K-118 Submarine . . . . .	371
IV.1.11.9	K-136 Submarine . . . . .	373
IV.1.11.10	K-153 Submarine . . . . .	373
IV.1.12	Soviet Missile Submarines - Project 629A . . . . .	375
IV.1.12.1	K-36 submarine . . . . .	377
IV.1.12.2	K-72 Submarine . . . . .	377
IV.1.12.3	K-75 Submarine . . . . .	377
IV.1.12.4	K-79 Submarine . . . . .	377
IV.1.12.5	K-88 Submarine . . . . .	379
IV.1.12.6	K-91 submarine . . . . .	381
IV.1.12.7	K-93 Submarine . . . . .	383
IV.1.12.8	K-96 Submarine . . . . .	383
IV.1.12.9	K-99 Submarine . . . . .	383
IV.1.12.10	K-126 Submarine . . . . .	383
IV.1.12.11	K-129 Submarine (Proekt 629) . . . . .	383
IV.1.12.12	K-139 Submarine . . . . .	383
IV.1.12.13	K-142 Submarine . . . . .	384
IV.1.12.14	K-163 Submarine . . . . .	386
IV.1.13	Soviet Missile Submarines - Project 658 . . . . .	386
IV.1.13.1	K-16 submarine . . . . .	388
IV.1.13.2	K-19 Submarine . . . . .	390
IV.1.13.3	K-33 submarine . . . . .	392
IV.1.13.4	K-40 submarine . . . . .	394
IV.1.13.5	K-55 submarine . . . . .	394
IV.1.13.6	K-145 Submarine . . . . .	394
IV.1.13.7	K-149 Submarine . . . . .	396
IV.1.13.8	K-178 Submarine . . . . .	396
IV.1.14	Soviet Missile Submarines - Project 667/667A . . . . .	398

IV.1.14.1	K-26 submarine . . . . .	400
IV.1.14.2	K-32 submarine . . . . .	402
IV.1.14.3	K-137 Submarine . . . . .	404
IV.1.14.4	K-140 Submarine . . . . .	406
IV.1.14.5	K-207 Submarine . . . . .	408
IV.1.14.6	K-210 Submarine . . . . .	408
IV.1.14.7	K-214 Submarine . . . . .	408
IV.1.14.8	K-216 Submarine . . . . .	410
IV.1.14.9	K-219 Submarine . . . . .	410
IV.1.14.10	K-228 submarine . . . . .	410
IV.1.14.11	K-236 submarine . . . . .	412
IV.1.14.12	K-241 submarine . . . . .	414
IV.1.14.13	K-245 submarine . . . . .	414
IV.1.14.14	K-249 Submarine . . . . .	416
IV.1.14.15	K-252 submarine . . . . .	416
IV.1.14.16	K-253 Submarine . . . . .	418
IV.1.14.17	K-258 Submarine . . . . .	420
IV.1.14.18	K-339 Submarine . . . . .	422
IV.1.14.19	K-389 submarine . . . . .	422
IV.1.14.20	K-395 submarine . . . . .	422
IV.1.14.21	K-403 submarine . . . . .	424
IV.1.14.22	K-408 Submarine . . . . .	424
IV.1.14.23	K-411 Submarine . . . . .	424
IV.1.14.24	K-415 Submarine . . . . .	424
IV.1.14.25	K-418 Submarine . . . . .	426
IV.1.14.26	K-420 Submarine . . . . .	428
IV.1.14.27	K-423 Submarine . . . . .	428
IV.1.14.28	K-426 Submarine . . . . .	430
IV.1.14.29	K-430 Submarine . . . . .	430
IV.1.14.30	K-434 Submarine . . . . .	432
IV.1.14.31	K-436 Submarine . . . . .	434
IV.1.14.32	K-444 submarine . . . . .	436
IV.1.14.33	K-446 submarine . . . . .	438
IV.1.14.34	K-451 submarine . . . . .	438
IV.1.15	Soviet Missile Submarines - Project 667B . . . . .	438
IV.1.15.1	K-171 Submarine . . . . .	440
IV.1.15.2	K-279 Submarine . . . . .	442
IV.1.15.3	K-336 submarine . . . . .	444
IV.1.15.4	K-385 submarine . . . . .	444
IV.1.15.5	K-417 Submarine . . . . .	446
IV.1.15.6	K-447 Kislovodsk Submarine . . . . .	446
IV.1.15.7	K-450 submarine . . . . .	448
IV.1.15.8	K-457 Submarine . . . . .	448
IV.1.15.9	K-460 Submarine . . . . .	450
IV.1.15.10	K-465 Submarine . . . . .	452
IV.1.15.11	K-472 Submarine . . . . .	452
IV.1.15.12	K-475 Submarine . . . . .	454
IV.1.15.13	K-477 Submarine . . . . .	456
IV.1.15.14	K-497 Submarine . . . . .	458
IV.1.15.15	K-500 Submarine . . . . .	458
IV.1.15.16	K-512 submarine . . . . .	458
IV.1.15.17	K-523 submarine . . . . .	460
IV.1.15.18	K-530 submarine . . . . .	462
IV.1.16	Soviet Missile Submarines - Project 667BD . . . . .	464
IV.1.16.1	Unknown 667BD (Murena-M, Delta 2) class submarine . . . . .	466
IV.1.16.2	K-92 Submarine . . . . .	468

IV.1.16.3	K-182 60 Let Velikogo Oktyabria Submarine . . . . .	470
IV.1.16.4	K-193 Submarine . . . . .	470
IV.1.16.5	K-421 Submarine . . . . .	472
IV.1.17	Soviet Missile Submarines - Project 667BDR . . . . .	474
IV.1.17.1	K-44 Ryazan Submarine . . . . .	476
IV.1.17.2	K-129 Submarine (Proekt 667BDR) . . . . .	478
IV.1.17.3	K-180 Submarine . . . . .	480
IV.1.17.4	K-211 Petropavlovsk-Kamchatkiy submarine . . . . .	482
IV.1.17.5	K-223 Podolsk submarine . . . . .	484
IV.1.17.6	K-424 Submarine . . . . .	486
IV.1.17.7	K-433 Svyaity Georgiy Pobedonosets . . . . .	488
IV.1.17.8	K-441 submarine . . . . .	490
IV.1.17.9	K-449 submarine . . . . .	492
IV.1.17.10	K-455 submarine . . . . .	492
IV.1.17.11	K-487 Submarine . . . . .	492
IV.1.17.12	K-490 Submarine . . . . .	494
IV.1.17.13	K-496 Borisoglebsk submarine . . . . .	496
IV.1.17.14	K-506 Zelenograd submarine . . . . .	498
IV.1.17.15	Unknown Kalmar (667 BDR, Delta III) class sub . . . . .	500
IV.1.18	Soviet Missile Submarines - Project 667BDRM . . . . .	502
IV.1.18.1	Unknown 667BDRM (Delfin, Delta 4) class submarine . . . . .	504
IV.1.18.2	K-18 Karelia submarine . . . . .	506
IV.1.18.3	K-51 Verkhoturiye Submarine . . . . .	508
IV.1.18.4	K-64 Podmoskovye Submarine . . . . .	510
IV.1.18.5	K-84 Ekaterinburg Submarine . . . . .	512
IV.1.18.6	K-114 Tula Submarine . . . . .	514
IV.1.18.7	K-117 Bryansk Submarine . . . . .	516
IV.1.18.8	K-407 Novomoskvosk Submarine . . . . .	518
IV.1.19	Soviet Missile Submarines - Project 941 . . . . .	520
IV.1.19.1	TK-12 Simbirsk submarine . . . . .	522
IV.1.19.2	TK-13 submarine . . . . .	524
IV.1.19.3	TK-17 Arkhangelsk submarine . . . . .	526
IV.1.19.4	TK-20 Severstal submarine . . . . .	528
IV.1.19.5	TK-202 submarine . . . . .	530
IV.1.19.6	TK-208 Dmitriy Donskoy submarine . . . . .	532
IV.1.20	Soviet Missile Submarines - Project 955 . . . . .	534
IV.1.20.1	K-535 Yuriy Dolgorukiy submarine . . . . .	536
IV.1.20.2	K-549 Knyaz Vladimir submarine . . . . .	538
IV.1.20.3	K-550 Aleksandr Nevskiy submarine . . . . .	540
IV.1.20.4	K-551 Vladimir Monomakh . . . . .	542
IV.1.20.5	K-552 Knyaz Oleg . . . . .	544
IV.1.20.6	K-553 Generalissimus Suvorov . . . . .	546
IV.1.20.7	K-554 Imperator Aleksandr Tretii . . . . .	548
IV.1.21	Soviet Missile Submarines - Launches from unknown sub . . . . .	550
IV.1.21.1	Unknown Soviet/Russian sub . . . . .	552
IV.1.22	US Navy Polaris Submarines . . . . .	555
IV.1.22.1	USS George Washington . . . . .	561
IV.1.22.2	USS Patrick Henry . . . . .	563
IV.1.22.3	USS Theodore Roosevelt . . . . .	565
IV.1.22.4	USS Robert E Lee . . . . .	567
IV.1.22.5	USS Abraham Lincoln . . . . .	569
IV.1.22.6	USS Ethan Allen . . . . .	571
IV.1.22.7	USS Thomas A Edison . . . . .	573
IV.1.22.8	USS Sam Houston . . . . .	575
IV.1.22.9	USS John Marshall . . . . .	577
IV.1.22.10	USS Thomas Jefferson . . . . .	579

IV.1.22.11	USS Lafayette . . . . .	581
IV.1.22.12	USS Alexander Hamilton . . . . .	583
IV.1.22.13	USS Andrew Jackson . . . . .	585
IV.1.22.14	USS John Adams . . . . .	587
IV.1.22.15	USS James Monroe . . . . .	589
IV.1.22.16	USS Nathan Hale . . . . .	591
IV.1.22.17	USS Woodrow Wilson . . . . .	593
IV.1.22.18	USS Henry Clay . . . . .	595
IV.1.22.19	USS Daniel Webster . . . . .	597
IV.1.22.20	USS James Madison . . . . .	599
IV.1.22.21	USS Tecumseh . . . . .	601
IV.1.22.22	USS Daniel Boone . . . . .	603
IV.1.22.23	USS John C Calhoun . . . . .	605
IV.1.22.24	USS Ulysses S Grant . . . . .	607
IV.1.22.25	USS Von Steuben . . . . .	609
IV.1.22.26	USS Casimir Pulaski . . . . .	611
IV.1.22.27	USS Stonewall Jackson . . . . .	613
IV.1.22.28	USS Sam Rayburn . . . . .	615
IV.1.22.29	USS Nathanael Greene . . . . .	617
IV.1.22.30	USS Benjamin Franklin . . . . .	619
IV.1.22.31	USS Simon Bolivar . . . . .	621
IV.1.22.32	USS Kamehameha . . . . .	623
IV.1.22.33	USS George Bancroft . . . . .	625
IV.1.22.34	USS Lewis and Clark . . . . .	627

# Chapter I.1

## Preface

The General Catalog of Artificial Space Objects (GCAT) makes public the full satellite database that underlies Jonathan's Space Report (<https://planet4589.org/jsr.html>)

The diagram below indicates the general structure of the database, which reflects the data model of the information it describes.

An artificial space **object** (for short, in future simply 'object') a satellite or spacecraft (active payload, rocket stage, discarded component, piece of debris) outside the Earth's lower atmosphere. At a given time it can be in one of the following **object states**:

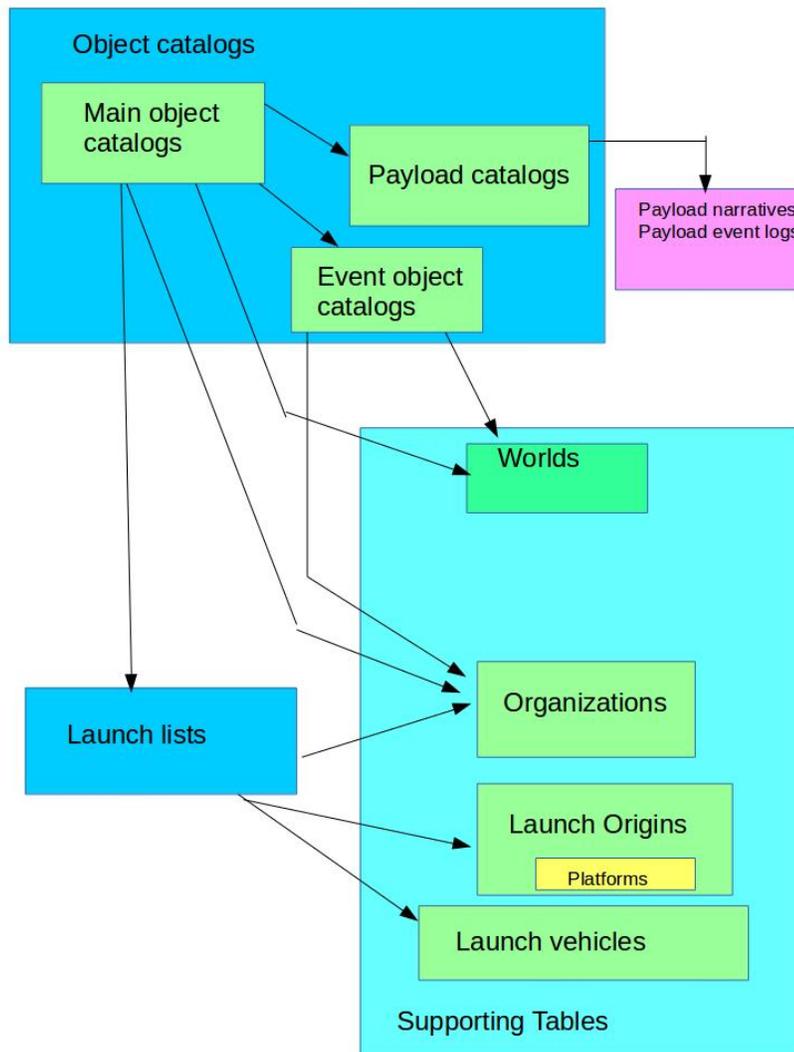

- Attached to another object
- In free flight in the gravitational field of a **world** or astronomical **body**
- On the surface of an astronomical body
- Destroyed (in a collision, explosion or by burnup in atmospheric entry).

Each time the object transitions to another state (undocks, is attached to something, reenters, changes which body it is orbiting, etc.) marks the beginning or end of a **phase**. Most objects in GCAT have only a single phase - they separate from an object (launch vehicle) and then are either still in free flight or have reentered. However, some objects go through many phases.

The main object catalogs define and list the first phase of each object. Objects with more than one phase have their subsequent phases listed as entries in the event object catalogs. A subset of objects are considered **payloads** and have additional data in the payload catalogs.

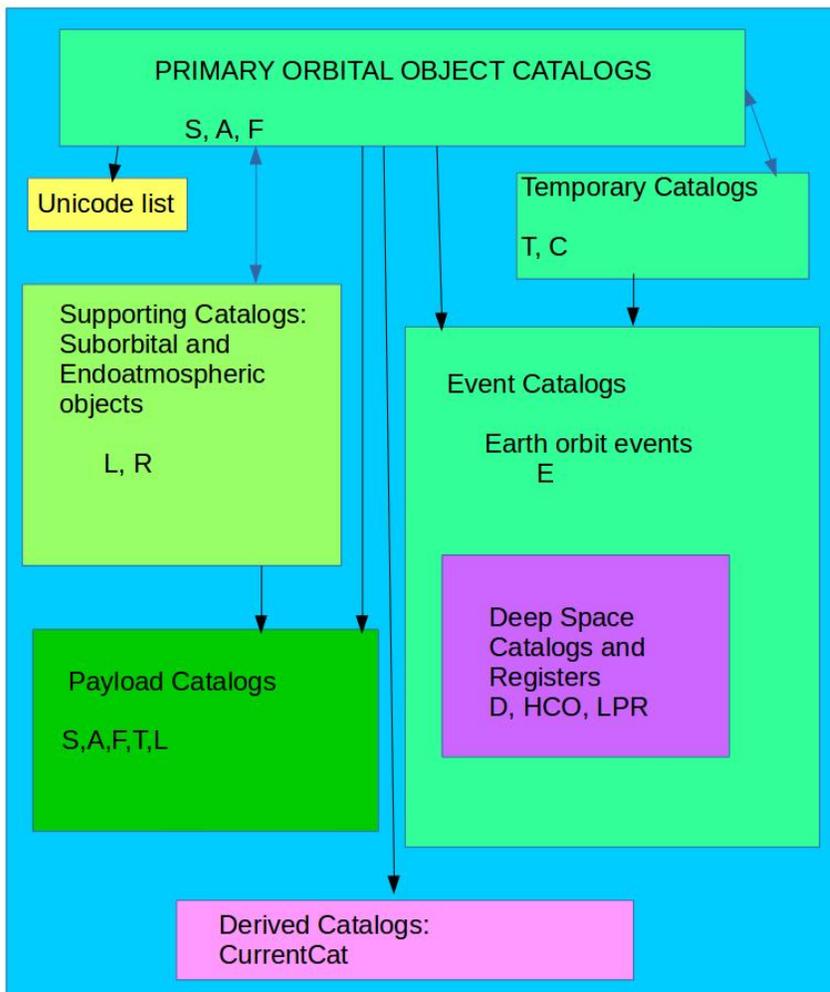

Each object (with rare exceptions) is associated with a single **launch**, described in the launch lists. Each launch may be associated with many objects. The launch lists are the same as those in the already-published LVDB.

Each launch is associated with a **launch vehicle** and a **launch origin** (generalization of launch site), and both launches and objects are associated with **organizations** of several kinds (countries, owners, manufacturers). These associations are expressed by strings which link the launch and object catalogs with the supporting tables.

GCAT – overall structure

Object catalogs – detailed structure

Figure: (1) Overall structure of GCAT. (2) Detailed structure of the object catalogs.

The supporting tables and the launch lists were published as GCAT release 1.0.2 in Aug 2020. Pre-release versions have been public for a decade as part of the Launch Vehicle Database (LVDB). (<https://planet4589.org/space/lvdb/index.html>) Release 1.1.0 is the first complete, formally versioned and documented release to include the object catalogs.

For each payload, there is also a payload narrative and a payload event log. However, these are considerably further from being ready for publication, so don't hold your breath.

Note that in fixed width versions of the table files, column names are truncated to the field width. Sorry about that!

### I.1.0.1 Citing GCAT

GCAT is released under the Creative Commons CC-BY licence. You are free to use the data in GCAT as long as you include a citation to it. A suitable short citation is 'data from GCAT (J. McDowell, planet4589.org/space/gcat)'. A full citation is

## **Part I**

# **Introduction**

## I.0.1 GCAT Release History

Release	Date	Notes
LVDB 2.0	2010 Oct 28	Added 1950s Soviet missiles from Asif Siddiqi
LVDB 2.1	2011 Nov 17	general update
LVDB 2.2	2014 Aug 25	Added many new Soviet ICBM launches provided by a Russian source, general update
LVDB 2.3	2014 Oct 6	Added a number of launches from El Arenosillo, Spain, and assorted launch times for US missiles, re
LVDB 2.4	2014 Nov 11	with more data on Soviet launches.
LVDB 2.5	2015 Jan 12	
LVDB 2.6	2015 Jul 16	
LVDB 2.7	2015 Dec 22	with new USSR launch time data from Andrey Krasil'nikov
LVDB 2.8	2016 Dec 30	
LVDB 2.9	2017 Sep 7	
LVDB 2.10	2017 Dec 28	
LVDB 2.11	2019 Dec 24	there were multiple unversioned minor data updates in 2017-2020
LVDB 2.12	2020 Jun 14	Changed launch site codes
GCAT 1.0.1	2020 Jun 19	Pre-release with supporting files only: Orgs, Sites, Platforms
GCAT 1.0.2	2020 Aug 9	Pre-release with supporting files and launch lists, supersedes LVDB
GCAT 1.1.0	2020 Aug 23	First full release with object catalogs
GCAT 1.1.1	2020 Aug 23	Added omitted documentation (intro/orbits.html)
GCAT 1.1.2	2020 Aug 23	Fixed a few typos and incorrect links
GCAT 1.1.3	2020 Aug 28	Added some Chinese missile bases to Sites file, minor doc updates
GCAT 1.1.4	2020 Sep 1	Added new section DERIVED CATALOGS with new catalog 'currentcat'. Updated OX flags for lost
GCAT 1.1.5	2020 Sep 1	Changed the structure of 'currentcat' to fix some issues.
GCAT 1.1.6	2020 Sep 25	Added new field 'Ac' (active satellite flag) to 'currentcat'
GCAT 1.1.7	2020 Dec 30	Added new derived catalog LAUNCHLOG to replace old launchlog.txt, and new intro section on U la
GCAT 1.1.8	2021 Jan 23	Added TF and ATT columns to payload catalogs and updated possible values for MVR column
GCAT 1.1.9	2021 Mar 13	Added support for 'D' descriptor for cubesat deployers in byte 2 of SatType
GCAT 1.1.10	2021 Apr 4	Added Starlink failure codes to SatType byte 8
GCAT 1.2.0	2021 Jul 21	Introduced 'NomCode' nomenclature code support (with only a few values filled)
GCAT 1.2.1	2021 Aug 17	Added new phase type 'C' for in-orbit collisions (intro/phases.html) and new launch designation 'UN
GCAT 1.2.2	2021 Oct 17	Added new crossindex for deepcat entries, added REFLT status code for relaunched objects, changed
GCAT 1.2.3	2021 Nov 30	Added column-description documentation for derived (currentcat, launchlog) tables.
GCAT 1.2.4	2022 Jan 18	Added new column 'plane' in payload catalogs to record constellation planes
GCAT 1.2.5	2022 Feb 14	Added parent and sep date columns to 'currentcat' to help generate debris history plots
GCAT 1.2.6	2022 Feb 15	Added persistent analyst objects to currentcat, and documentation of analyst objects to intro.
GCAT 1.2.7	2022 Feb 16	Added SatType field to derived catalog 'launchlog' and updated documentation.
GCAT 1.2.8	2022 Mar 24	Changed meaning of SatType byte 4 value 'K'
GCAT 1.2.9	2022 Mar 25	Added C3 and SpE values to special (U) launch table
GCAT 1.2.10	2022 Apr 20	Added orbital period to derived file 'currentcat'
GCAT 1.2.11	2022 Apr 28	Added lower case 'c' option in sat type for objects with newly-declassified orbital data, see type.html
GCAT 1.2.12	2022 Jun 11	Minor documentation corrections
GCAT 1.2.13	2022 Sep 12	Added geosync orbit catalog
GCAT 1.3.0	2022 Sep 25	Added launch service codes and launch profile codes
GCAT 1.3.1	2022 Sep 26	LEO upper boundary changed to 2000 km (was previously 2 hour period)
GCAT 1.3.2	2022 Dec 2	SatType bytes 11 and 12 defined.
GCAT 1.3.3	2022 Dec 26	CurrentCat added Owner and State fields, current owners for defunct sats updated
GCAT 1.3.4	2023 Mar 27	Added missing documention to phases.html about OI, OE cases.
GCAT 1.4.0	2023 Apr 13	Changed suborbital targeted reentry values from 'R' to 'S' to distinguish from uncontrolled reentry
GCAT 1.5.0	2023 Sep 22	Changed status value EVA to EVA RP and for spacesuits, TFR E changed to EVA DP (repress, depres
GCAT 1.5.1	2023 Oct 1	Added status byte 6 value of G for generic cargo accounting, and clarified use of values for all station
GCAT 1.5.2	2023 Oct 6	Added status values TO (LO from small bodies) and LOA (extraterrestrial REFLT, LO attached), RET
GCAT 1.5.4	2023 Oct 24	Added Owner and State fields to (derived) launchlog file.
GCAT 1.5.5	2024 May 5	Added Orbit Payload (OPAY) column to launch lists
GCAT 1.5.6	2024 Oct 13	Added Disposal Orbit columns to payload catalogs
GCAT 1.5.7	2024 Oct 18	Reordered payload catalog columns

# Chapter I.1

## I. Definitions and Conventions

### I.1.1 Time Representations and Vague Date Format

#### I.1.1.1 Time Scales

All dates in GCAT are at least nominally in Coordinated Universal Time (UTC). Comparing launches and orbital events occurring across the world requires a global timescale - local time zones are useless. UTC, like local times, has the bad feature that it is not continuous - there are occasional leap seconds.

An even better choice of timescale would be a continuous one, such as TT, TDB or TCB. JPL Horizons data is expressed in TDB, but most data in the space community is in UTC, and (at least for this release) I have reluctantly decided to go with the crowd.

Nontechnical readers may be more familiar with UTC by the essentially equivalent name GMT (Greenwich Mean Time). The US military tags time zones with the phonetic alphabet, with UTC/GMT as zone 24 known as Z (Zulu) time.

Note, however that UTC is not a time zone per se - it is not restricted to a particular range of longitudes; and of course, it never has daylight savings time.

#### I.1.1.2 Julian Date

We can express dates numerically using the Julian Date (JD). The JD day number is a continuous count of days starting at noon UTC on BC 4713 Jan 1 Old Style/Julian calendar, which is noon UTC on BC 4714 Nov 24 New Style/Gregorian calendar.

Times within a day are expressed as decimal days. Remember that the JD always starts at noon. For example, 0600 UTC on 2020 Aug 1 is JD 2459062.7500; 1800 UTC on 2020 Aug 1 is JD 2459063.2500.

Note that 12:00 UTC on Jan 1, 2000 is JD 2451545.0. This special epoch is the fundamental epoch of modern astronomy, known as J2000.0 for short.

Estimated launch times of rockets are provided as JD values to make it easy to sort the data and carry out computations. However, some launch times are uncertain - even only known to the nearest year or so. This uncertainty is incorporated in a human-readable date field that uses what I call the Vague Date Format, defined in the next section.

---

### I.1.1.3 Vague Date Format

Dates in the General Catalog are usually recorded as strings in what I call the 'Vague Date' format. A Vague Date string defines a time range within which an event is believed to lie.

Many astronomical databases include dates which are actually approximate but are given as if they are precise. For example, a rocket which is only known to have launched sometime in 1984 may be entered with a date of 1984 Jan 1 0000:00 as if it was known to the nearest second. This is particularly common if the date is stored as a single real number (e.g. Julian Day value).

To fix this, every date field should actually be a pair of values - either two dates as a confidence interval or a date and an uncertainty value. This adds storage, maintenance and I/O software overhead to the handling of dates.

As a compromise between this additional overhead and following the common practice of ignoring the problem, the Vague Date string format translates to a time confidence interval with a particular precision. A maximal-precision Vague Date is of the form

2016 Jun 8 2359:57.345

which is interpreted as UTC in a geocenter-fixed frame, lying in the millisecond between 2359:57.3450 and 2359:57.3460 UTC. Note that there must be two spaces between "Jun" and "8" here.

We provide the ability to encode greater uncertainty by allowing rightmost fields to be omitted, and optionally a question mark symbol to be appended.

In the General Catalog we only allow 1 second precision, so e.g.

2016 Jun 8 2359:57

The full specification of the format is as a series of fields increasing in precision from left to right, with a possible question-mark suffix. The only mandatory field is the year, but if a field is present so must all the fields to the left of it, except for the optional leftmost 'domain' field.

The fields are:

- **Domain, consisting of the string AD or BC.** This is usually omitted and the value AD is assumed. Of course, we don't normally need BC for space events! But I use the same format for astronomy, where we do have observations of supernovae and comets before 1 AD.

It's true that nowadays academic historians would advocate using the 'common era' designations CE and BCE to avoid Christian associations, but, having grown up with BC and AD, I find this overly precious despite my atheism - if you are going to worry about that, perhaps you should change the zero point (to the Space Era of 1957, for example).

- **Year field.**

This can be either:

- The (Gregorian) year, as an integer; or
- A century descriptor, format: integer followed by letter. The letter can be C or M for century or millenium. For example, 20C means between 1901 Jan 1 and 2001 Jan 1; M indicates a millenium; 3M means between 2001 Jan 1 and 3001 Jan 1. Usually for astronomical applications we know the date more accurately than a century!

- **Month (generalized month), consisting of the (case sensitive) strings** Jan, Feb, .... Dec, and the special strings Q1, Q2, Q3, Q4 indicating the year-quarters Jan-Mar, Apr-Jun, Jul-Sep, Oct-Dec respectively.
- **Day, an integer in the range 1, 31 always right justified** in a two byte field.
- **Time, in one of two formats:**

- **Centiday:** A day decimal fraction with one or two significant digits. This format was used by the RAE table of Earth Satellites and related satellite tabulations.
- **HMS:** A time in the format hhmm:ss.sss (where trailing items can be omitted) parsed as:
  - The hour, 00 to 24 (leading zeroes required)
  - Minute, 00 to 60 (leading zeroes required), appended to the hour value without any separator.
  - Second, 00 to 60 (leading zeroes required), appended to the minutes with a colon separator.
  - Millisecond, 000 to 999, appended to the seconds with a decimal point
- **Schedule flag, an optional trailing 's' to indicate a scheduled date, where the**
- **Flag, An optional trailing question mark to indicate uncertainty.**

Here are a selection of valid Vague Date strings and their mapping to a date confidence interval.

Precision	Vague Date	Range implied (semi-open interval)	Width
Millisec	2016 Jun 8 2355:57.345	2016 Jun 8 2355:57.345 to 57.346	1ms
Second	2016 Jun 8 2355:57	2016 Jun 8 2355:57.0 to 2355:58.0	1s
Seconds	2016 Jun 8 2355:57?	2016 Jun 8 2355:56.0 to 2355:59.0	3s
Minute	2016 Jun 8 2355	2016 Jun 8 2355:00 to 2356:00	1m
Minutes	2016 Jun 8 2355?	2016 Jun 8 2354:00 to 2357:00	3m
Centiday	2016 Jun 8.98	2016 Jun 8 2331:12 to Jun 8 2345:36	0.01d
Centidays	2016 Jun 8.98?	2016 Jun 8 2316:48 to Jun 9 0000:00	0.03d
Hour	2016 Jun 8 23h	2016 Jun 8 2300:00 to Jun 9 0000:00	1h
Hours	2016 Jun 8.9	2016 Jun 8 2136:00 to Jun 9 0000:00	2.4h
Day	2016 Jun 8	2016 Jun 8 0000 to 2016 Jun 9 0000	1d
Day (scheduled)	2016 Jun 8s	2016 Jun 8 0000 to 2016 Jun 9 0000	1d
Days	2016 Jun 8?	2016 Jun 7 0000 to 2016 Jun 10 0000	3d
Month	2016 Jun	2016 Jun 1 0000 to 2016 Jul 1 0000	1mo
Months	2016 Jun?	2016 May 1 0000 to 2016 Aug 1 0000	3mo
Quarter	2016 Q2	2016 Apr 1 0000 to 2016 Jul 1 0000	3mo
Quarters	2016 Q2?	2016 Jan 1 0000 to 2016 Oct 1 0000	9mo
Year	2016	2016 Jan 1 0000 to 2017 Jan 1 0000	1y
Years	2016?	2015 Jan 1 0000 to 2018 Jan 1 0000	3y
Decade	2010s	2010 Jan 1 0000 to 2020 Jan 1 0000	10y
Decades	2010s?	2000 Jan 1 0000 to 2030 Jan 1 0000	30y
Century	21C	2001 Jan 1 0000 to 2101 Jan 1 0000	100y
Centuries	21C?	1901 Jan 1 0000 to 2201 Jan 1 0000	300y
Millenium	3M	2001 Jan 1 0000 to 3001 Jan 1 0000	1000y
Millenia	3M?	1001 Jan 1 0000 to 4001 Jan 1 0000	3000y

Some additional special values:

Unknown	?	Date entirely unknown
Current	*	Now (for an end date, indicating still active, etc.)

## I.1.2 Space and Orbit

### I.1.2.1 Where Does Space Begin? 80 km!

In GCAT, I have lists of objects in space as well as some list of objects in the atmosphere. Where does space begin, though? How do we define it? I have written extensively about this question, and the answer (at least for GCAT) is that space begins at 80 km above the geoid. See my paper on the subject: (See McDowell (2018), Acta Astronautica 151, 668)

---

The paper also discusses the EL1:4 boundary that I use to mark the start of deep space, which lies at 152066 km from the Earth's center.

### I.1.2.2 Orbit

Being in space is not at all the same thing as being in orbit. At least, in the sense of a closed (elliptical or circular) orbit that does not intersect the Earth.

To be strict, though, there are several senses of the word **orbit**. In its broadest sense, an orbit is any trajectory of an object in the local gravitational field. If you stand on the Earth and throw a ball in the air (or make an apple fall from a tree) its path (neglecting aerodynamic effects) is not, as you were taught in school, a parabola. It is in fact a very eccentric ellipse with the perigee extremely close to the center of the Earth. The ball will complete a very small part of this orbit before the surface of the Earth gets in its way. In this sense, 'suborbital' rockets are in fact just orbital rockets with negative perigee height.

Because even many people in the space field don't appreciate this, it's worth doing the worked example. Suppose we throw a ball at a 45 degree angle and a moderate speed of 50 km/hr (13.9 m/s); let us assume we are in Harvard Square (42.4 deg N) and throw the ball due eastwards. The resulting orbit is -6371.8 x -10.0 km x 42.4 deg, an eccentricity of 0.998. (As noted in the section on apogees and perigees, we quote the heights relative to a fictitious 6378 km spherical Earth, and due to oblateness Harvard Square is 10 km below the zero surface.)

At the other extreme, an orbit around the Earth can also be hyperbolic, with eccentricity greater than 1. When a rocket reaches escape velocity, many writers say 'it is now in solar orbit'. From the point of view of calculating its trajectory in an N-body solar system simulator that's not the right way to think about it. The object is travelling away from Earth very fast, but it's still deep in the terrestrial gravity well, far below the geostationary satellites, and the differential effects of the Sun's gravity are negligible. Only several days later does the object reach the edge of the Sun-Earth Hill sphere where it is a better approximation to model it as orbiting the Sun. Until then, I consider it to be in Earth orbit, albeit an unbound one on an escape trajectory.

Different categories of orbit (LEO, GEO etc) are noted in the catalogs and defined in (See the Orbital Categories ) section.

## I.1.3 Orbital Parameters and Coordinate Frames

### I.1.3.1 Perigee and Apogee

The perigee and apogee are respectively the closest and furthest points of the orbit from the Earth's surface. This apparently simple definition has some complications.

In the strictest meaning of the words, the perigee and apogee are **points** in an elliptical orbit at which the orbiting object has the smallest and largest radius vectors respectively. They lie at opposite ends of the semi-major axis of the ellipse.

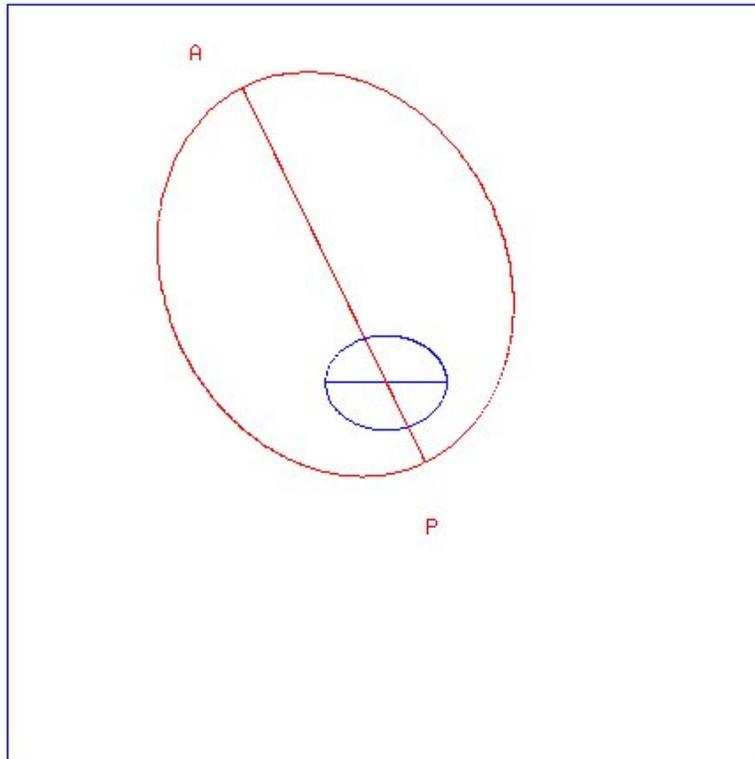

We often refer to the perigee and apogee **heights**; i.e. the height of the perigee and apogee points above the planetary surface. Loosely, we drop the word 'height' and refer to these values simply as the perigee and apogee.

But complications arise when you start thinking about the fact that the Earth is not actually a sphere, but (to a much better approximation) an oblate spheroid - its cross-section is also an ellipse. Depending on the orientation of the orbit, the two ellipses are misaligned. In the figure below, a satellite orbit in red is drawn around an exaggerated Earth in blue. In this case, the smallest height of the orbit around the spheroid Earth is not necessarily the height of the perigee point P. In fact in the example shown, the point of smallest height is about 40 degrees further around the orbit.

Worse yet, the flattening of the Earth means that the orbit is not actually an ellipse. The instantaneous ('osculating') orbital parameters **change with time** as you go round the orbit, so the true perigee and apogee are different from ones obtained from time-averaged 'mean elements'.

---

**It is conventional in space situational awareness contexts to quote perigee and apogee heights relative to a fictitious perfectly spherical Earth with radius equal to the equatorial radius.** There are a lot of reasons that this makes good sense, but the reader should remember that the actual height above the Earth may be considerably higher if the perigee is over the polar regions.

### **I.1.3.2 The Friends of Perigee and Apogee**

The 'gee' in apogee and perigee is from the Greek word for the Earth. For orbits around other bodies, special names are in use. Most of these are falling out of favour and are being replaced by the terms periapsis and apoapsis, referring to the 'apsis' (plural, apsides), the generic name for the extreme points in the orbit. There are several terms used for selenocentric orbits. I list terms that I've seen in relatively recent use; there are many others. I'm torn between the poetry of them and the fact that they are totally unnecessary.

Central body	Terms	Plural
<b>Still in use</b>		
Earth	perigee, apogee	-gees
Sun	perihelion, aphelion	-helias
Moon	perilune, apolune	-lunes
Moon	periselene, aposelene	-selenes?
Mars	periares, apoares	-ares
Jupiter	perijove, apojove	-joves
Star	periastron, apoastron	-astrons
Galaxy	perigalacticon, apogalacticon	-icones? (not used)
<b>Probably obsolescent</b>		
Moon	pericynthion, apocynthion	-cynthia
Venus	pericytherion, apocytherion	
Saturn	perikrone, apokrone	
Black hole	peribothron, apobothron	-bothroi

### I.1.3.3 Coordinate Frames and Units

The orbital inclination (and the node and argument of perigee, which are not given in this release of GCAT) depends on the equator and pole of your coordinate frame.

In GCAT, angles are always expressed in degrees and distances are usually in km (but see below for heliocentric orbits).

- Earth orbits are given with respect to the equator of date (strictly, TEME equator). Note that astronomical positions are often given with respect to the (inertially fixed) ICRF frame. The Earth wobbles due to precession, so the equator of date changes with time relative to the ICRF. Distances are always given in km.
- Heliocentric orbits are given with respect to the J2000 ecliptic. Distances (aphelion and perihelion) are given in astronomical units (AU). 1 AU = 149597870.700 km.
- Orbits around other central bodies (Moon, Mars, etc.) are given with respect to the IAU equator of that body. Where no IAU equator is yet defined in JPL Horizons, the ecliptic is used instead. Distances are given in km.

### I.1.4 JCAT Identifiers

The General Catalog (GCAT) uses an alphanumeric identifier (JCAT, originally Jonathan's Catalog ID) to uniquely tag space objects. The identifier consists of a single prefix letter followed by a sequence number with either 5 or 9 digits (examples: A00022; S101234009). The 9 digit case is not yet in use, but is supported in anticipation of the introduction of 9-digit SATCAT numbers by the US DoD.

The leading letter tells you which object catalog the object belongs to, as follows:

JCAT letter	Catalog
A	auxcat (Auxiliary catalog)
C	csocat (Complementary catalog)
D	deepcat (Deep space catalog)
F	ftocat (Failed to orbit catalog)
L	lecat (low altitude catalog)
R	rcat (suborbital catalog)
S	stdcat (Standard catalog)
T	tmpcat (Temporary catalog)

Note that there are no prefix letters associated with the ecacat (event catalog), or the heliocentric and lunar-planetary registers, since they contain only objects already defined in the other catalogs.

---

Also, each object with a D (deep space catalog) designation also has an S or A catalog designation which applies when the object is within near-Earth space.

Sequence numbers in the A, D, F, L, R, and S catalogs are assigned sequentially starting with 00001. However, occasional numbers may be missing due to deletions of spurious or reassigned entries.

Sequence numbers in the C and T catalogs are not assigned sequentially.

Sequence numbers in the S catalog are in one-to-one correspondence with the US SATCAT catalog numbers. Thus, S46112 corresponds to SATCAT satellite 46112 (2020-056A).

In exceptional cases, future releases of GCAT may reassign existing catalog numbers. Any such reassignments will be recorded explicitly in an accompanying table. However, users who have found earlier (pre-GCAT) JCAT catalog numbers that crept into my public files have no such guarantee - in particular, auxcat numbers previously seen in public files may now refer to different objects.

### **I.1.4.1 Extended JCAT identifier**

The Parent field of the object catalogs supports what I call an ‘extended JCAT ID’. This consists of a JCAT ID and a **port location** separated by one or more spaces. The port location defines a specific part of the parent object where the object is attached. It’s usually only space station modules or spaceships that have port locations.

Examples of port locations are:

- Docking ports, e.g. A07305 N, Harmony nadir CBM
- JEM Exposed Facility EFU locations, e.g. A07559 EFU5
- ISS truss battery ORU locations, e.g. A07476 1B3

For the time being, there’s no formal definition table of these port locations.

In some cases in the object catalog Parent field an asterisk is appended to the identifier. This is a flag that the launch designation in the Piece field is not what you’d expect from the launch designation of the parent. In the normal situation, for example, S45920 has Piece designation 2020-048A, and its parent S45921 has 2020-048B - both are 2020-048 launch pieces. But S45916 has Piece designation 1998-067RP, and its parent is A09547\* with piece designation 2020-011, an apparent contradiction. In fact 2020-011 is the correct launch for both, with launch date 2020 Feb 15, but USSF assigns 1998-067 piece designations and a 1998 launch date for all objects released from the ISS. I added the asterisks to facilitate automatic checking: it lets you know to be careful about the launch date and launch information for this object.

## **I.1.5 Launch Designations and Piece Designations**

Each rocket launch in the database is labelled with a unique designation. For successful orbital launches, we use the International Designation (also called the COSPAR designation, after the Committee on Space Research which adopted the system.) For other launches, I use a variation on that scheme of my own design. I introduce the generalized concept of ‘launch designation’ to include the International/COSPAR designation and other similar schemes. The term ‘piece designation’ is also introduced to generalize the per-piece (per-cataloged-object) international designation.

Note that for catalog pieces in the SATCAT, the launch encoded in the international designation is not always the actual launch. In particular, all objects deployed from the ISS are give 1998-067 designations (the Zarya launch) even if they were launched on a much later cargo ship. However, the correct launch for an object can be found in the object catalogs by tracing back the Parent fields to the launch vehicle.

---

### I.1.5.1 The COSPAR designation

The COSPAR designation scheme applies to both launches and to cataloged orbiting objects. It has been in use since January 1963.

For launches, the scheme is of the form 'year - launch number in year'. For example, 2005-012 indicates the 12th launch to reach orbit in the year 2005.

For individual objects, a 'piece designation' is used, with a sequence of letters appended to the launch designation; 2005-012E is the fifth (E) piece associated with that launch. The piece letters run from A to Z, then AA to AZ, BA ... to ZZ, AAA to AAZ, etc., always omitting the letters I and O. Usually, the first piece letters are reserved for the main payloads, followed by the rocket stages, followed by debris. However, there are frequent exceptions to this rule.

You can think of the piece letter scheme as a base 24 number. The largest number of pieces assigned to a launch as of 2020 is for 1999-025; object 1999-025EYS is the 3449th piece from the launch ( $5 \times 24 \times 24 + 23 \times 24 + 17 = 3449$ ). The mapping of piece number to piece letter for the first 72 objects of a launch is given in the figure below for convenience.

Order	Piece Letter	Order	Piece Letter	Order	Piece Letter
1	A	25	AA	49	BA
2	B	26	AB	50	BB
3	C	27	AC	51	BC
4	D	28	AD	52	BD
5	E	29	AE	53	BE
6	F	30	AF	54	BF
7	G	31	AG	55	BG
8	H	32	AH	56	BH
9	J	33	AJ	57	BJ
10	K	34	AK	58	BK
11	L	35	AL	59	BL
12	M	36	AM	60	BM
13	N	37	AN	61	BN
14	P	38	AP	62	BP
15	Q	39	AQ	63	BQ
16	R	40	AR	64	BR
17	S	41	AS	65	BS
18	T	42	AT	66	BT
19	U	43	AU	67	BU
20	V	44	AV	68	BV
21	W	45	AW	69	BW
22	X	46	AX	70	BX
23	Y	47	AY	71	BY
24	Z	48	AZ	72	BZ

Usually the launch numbers are in chronological order within the year. There are, nevertheless, rare exceptions to this rule.

In principle, international designations are assigned to launches and pieces of launches which either complete a full orbit of the Earth or reach the Moon or beyond. Again, there are exceptions - launches which completed an orbit but did not get a designation, and launches or pieces which did not complete an orbit but got a designation anyway.

It is currently conventional to use three digits for the launch number, including leading zeros; e.g. 2020-005A. However, this is not part of the definition of the designation; e.g. 2020-05A is also a valid use and means the same thing.

As a special case, launch number 000 of the year is used for cataloged objects whose parent launch is unknown. This special case has been used very rarely and most of the relevant cases have since been identified with known launches and given revised designations. I tabulate all such cases here.

US Satcat Number	Original designation	Current designation	Notes
S02428	1966-000A	1965-058D	
S02429	1966-000B	1963-014DG	
S02430	1966-000C	1963-014DH	
S02431	1966-000D	1963-014AC	
S04924	1971-000A	1962 B LAM 2 (1962-059B)	
S04925	1971-000B	1964-086B	
S04926	1971-000C	1964-086C	
S05309	1971-000D	1965-108H	
S05310	1971-000E		maybe should be 1971-039D?
S40328	2014-000A	1982-029P	

### I.1.5.2 The Harvard designation

The first scheme for designating orbital launches was the Harvard scheme, invented by Fred Whipple and colleagues in 1957 and published in the Harvard Announcement Circulars from the Harvard Observatory. This was of the form "year - greek letter - piece number", as in 1957 $\alpha$ 2, indicating the second object of the first (Alpha) launch of 1957.

This system was used for launches until the end of 1962, and the last launch to use the scheme was 1962 $\beta\omega$ , which had two pieces, 1962 $\beta\omega$ 1 and 1962 $\beta\omega$ 2.

However, in later years when new debris objects were discovered from those launches, NORAD (acting on behalf of COSPAR) also designated them using the Harvard scheme. For example, in 1992 a new debris object from the Ablestar 008 breakup was cataloged as NORAD number 21986 and given international designation 1961 $\omicron$ 300 (1961 Omicron 300) using the Harvard scheme.

Designation of new objects had at some point been delegated to NORAD by COSPAR. However, it's not entirely clear that control of the scheme itself was designated. Thus, when in the late 1990s NORAD retrospectively reassigned all Harvard designations using the post-1963 scheme, it's not clear that was really a legitimate thing to do. From the point of view of historical consistency, I prefer to retain original designations rather than reassign them. Thus, although the US DoD now refers to object 21986 as 1961-015MM, I still use its original designation.

In most of my database files I map the Greek letters to an ASCII representation (mostly because I started this project long before Unicode was a thing). The representation used is indicated in the following table as 'Code'. 'Order' is the numerical order of launch (and the launch number in the new COSPAR scheme). I also provide the full English names of the Greek sequences, since the Greek alphabet may be less familiar to 21st-century readers.

Order	Sequence	Code	English name	Order	Sequence	Code	English name	Order	Sequence	Code	English name
1	$\alpha$	ALP	Alpha	25	$\alpha\alpha$	A ALP	Alpha Alpha	49	$\beta\alpha$	B ALP	Beta Alpha
2	$\beta$	BET	Beta	26	$\alpha\beta$	A BET	Alpha Beta	50	$\beta\beta$	B BET	Beta Beta
3	$\gamma$	GAM	Gamma	27	$\alpha\gamma$	A GAM	Alpha Gamma	51	$\beta\gamma$	B GAM	Beta Gamma
4	$\delta$	DEL	Delta	28	$\alpha\delta$	A DEL	Alpha Delta	52	$\beta\delta$	B DEL	Beta Delta
5	$\epsilon$	EPS	Epsilon	29	$\alpha\epsilon$	A EPS	Alpha Epsilon	53	$\beta\epsilon$	B EPS	Beta Epsilon
6	$\zeta$	ZET	Zeta	30	$\alpha\zeta$	A ZET	Alpha Zeta	54	$\beta\zeta$	B ZET	Beta Zeta
7	$\eta$	ETA	Eta	31	$\alpha\eta$	A ETA	Alpha Eta	55	$\beta\eta$	B ETA	Beta Eta
8	$\theta$	THE	Theta	32	$\alpha\theta$	A THE	Alpha Theta	56	$\beta\theta$	B THE	Beta Theta
9	$\iota$	IOT	Iota	33	$\alpha\iota$	A IOT	Alpha Iota	57	$\beta\iota$	B IOT	Beta Iota
10	$\kappa$	KAP	Kappa	34	$\alpha\kappa$	A KAP	Alpha Kappa	58	$\beta\kappa$	B KAP	Beta Kappa
11	$\lambda$	LAM	Lambda	35	$\alpha\lambda$	A LAM	Alpha Lambda	59	$\beta\lambda$	B LAM	Beta Lambda
12	$\mu$	MU	Mu	36	$\alpha\mu$	A MU	Alpha Mu	60	$\beta\mu$	B MU	Beta Mu
13	$\nu$	NU	Nu	37	$\alpha\nu$	A NU	Alpha Nu	61	$\beta\nu$	B NU	Beta Nu
14	$\xi$	XI	Xi	38	$\alpha\xi$	A XI	Alpha Xi	62	$\beta\xi$	B XI	Beta Xi
15	$\omicron$	OMI	Omicron	39	$\alpha\omicron$	A OMI	Alpha Omicron	63	$\beta\omicron$	B OMI	Beta Omicron
16	$\pi$	PI	Pi	40	$\alpha\pi$	A PI	Alpha Pi	64	$\beta\pi$	B PI	Beta Pi
17	$\rho$	RHO	Rho	41	$\alpha\rho$	A RHO	Alpha Rho	65	$\beta\rho$	B RHO	Beta Rho
18	$\sigma$	SIG	Sigma	42	$\alpha\sigma$	A SIG	Alpha Sigma	66	$\beta\sigma$	B SIG	Beta Sigma
19	$\tau$	TAU	Tau	43	$\alpha\tau$	A TAU	Alpha Tau	67	$\beta\tau$	B TAU	Beta Tau
20	$\upsilon$	UPS	Upsilon	44	$\alpha\upsilon$	A UPS	Alpha Upsilon	68	$\beta\upsilon$	B UPS	Beta Upsilon
21	$\phi$	PHI	Phi	45	$\alpha\phi$	A PHI	Alpha Phi	69	$\beta\phi$	B PHI	Beta Phi
22	$\chi$	CHI	Chi	46	$\alpha\chi$	A CHI	Alpha Chi	70	$\beta\chi$	B CHI	Beta Chi
23	$\psi$	PSI	Psi	47	$\alpha\psi$	A PSI	Alpha Psi	71	$\beta\psi$	B PSI	Beta Psi
24	$\omega$	OME	Omega	48	$\alpha\omega$	A OME	Alpha Omega	72	$\beta\omega$	B OME	Beta Omega

### I.1.5.3 JSR scheme

In the data files associated with my newsletter Jonathan's Space Report (JSR), I introduced a new designation scheme for launches not covered by the existing international designations.

You can call this the "JSR" scheme or even the "New Harvard" scheme (technically I work for the Smithsonian Institution's SAO, and I'm doing this on my own time, but to the extent that I'm on the Harvard campus and support space-related outreach inquiries for the Harvard-Smithsonian Center for Astrophysics, and recalling that Fred's satellite support team was an SAO program too, it's good enough.)

The only other comprehensive scheme for suborbital launch designations that I am aware of was from the World Data Center for Rockets and Satellites-A (WDC/RS-A) at NASA-Goddard. They assigned numbers to sounding rockets using a scheme of the form Rymm-ddnn - example, R7402-1311 for the 11th cataloged launch on 1974 Feb 13. They only covered scientific sounding rockets (not, e.g., missile launches or failed orbital launches). I considered retaining these designations but instead have found it more useful to use a scheme similar to international designations for orbital launches.

My scheme is similar to the current international designation except that a 'class letter' is added following the hyphen. The letter used indicates the type of launch, as described below. For example, the class letter F denotes a failed orbital launch attempt and the designation 2005-F03 indicates the third failed attempt in the year 2005.

Since the non-orbital catalog is incomplete, and I often identify previously undocumented historical launches, there are many more cases of launch numbers that are not chronological. Thus, 1961-S227 may have a launch date later than 1961-S511. Ordering within a year is therefore essentially arbitrary (although I start off \*trying\* to make it chronological).

Another wrinkle is that launches can change designation. If I've got documentation on a Nike Apache launch with no information on apogee, I may assume it worked and give it an S designation. If I later find it failed at low altitude, I will retire the S designation and assign a new A designation. I've been rather cavalier about this until now, but hope to be better in future about recording such changes explicitly.

Note that the JSR scheme is only for launches - there is no equivalent of the 'piece letter', at least for now. For space catalog objects from such launches, my practice is to use the launch designation in the 'piece designation' field. Thus, all objects from launch 2005-F03 have JSR designation 2005-F03, rather than being 2005-F03A, 2005-F03B, etc.

The categories used are presented in the following table:

Class Letter	Launches	Criteria
(none)	Orbital launch with COSPAR designation.	
A	Endoatmospheric flight	apogee less than 50 km.
E	Pad explosion	rocket blew up, apogee in controlled flight less than a few cm
F	Failed orbital launch attempt	
M	Mesospheric flight	apogee between 50 and 80 km
S	Suborbital space launch	apogee more than 80 km
U	Uncataloged orbital-energy launch	See below.
W	Mesospheric flight	same as M, obsolete
Y	Suborbital space launch	same as S, obsolete

Orbital launch failures (class F) also satisfy the criteria for either A, M or S classes, but differ in that the intent was to achieve orbit. (F overrides A, M or S; but U overrides F.)

Some small meteorological rocket launches have W and Y class letters. I have discontinued assigning new launch designations in these classes, and the existing ones should be treated as if they were in classes M and S respectively.

I use 'U' to indicate a launch that should have received a regular designation but did not (e.g. 1995-U01). I also use it for a small set of interesting launches which had total energy (kinetic + potential) equal or greater than that needed for low Earth orbit with positive perigee. This includes some low-perigee orbital attempts that reentered within one orbit and some high speed reentry tests.

Launches from worlds other than the Earth are given 'U' designations and marked as 'LO' (liftoff) in the event catalog status. Departures from rocks (objects that are not large enough to be round due to self-gravity, working definition: objects with radius less than 200 km) are also marked as 'LO' but are not given launch designations; they are considered to be a new phase in the existing launch.

#### I.1.5.4 Unknown objects

Sometimes we have to deal with objects of unknown origin - they cannot be associated with a launch. A few have entries in the official US catalog with a year assigned with launch number zero; designations like 1966-00C, for example. For objects not in the US catalog, I use the special designation 'UNK'.

#### I.1.6 SatType scheme

Associated with each object in the General Catalog is a 12 byte SatType string that provides a classification of the object. Each byte in the string has a set of defined meanings. (As of late 2022, byte 12 is unused). The SatType data in principle allows one to select subsets of certain kinds of object.

The SatType string can be found in the table column called simply 'Type'.

For each object, the SatType string in the entry for the first phase for that object applies to the whole history of the object. If the type is different in a later phase, that's probably a data entry error.

The byte layout is as follows:

Byte	Contents
Byte 1	Coarse Type (payload, rocket, debris)
Byte 2	Type modifier
Byte 3	Attach flag
Byte 4	Subtype
Byte 5	Orbit flag
Byte 6	Human spaceflight subset
Byte 7	UN registration flag
Byte 8	Failure flag
Byte 9	Uncertain ID flag
Byte 10	Annotation flag
Byte 11	Group control flag
Byte 12:	Not yet used

In each byte, an empty (null) value is represented by blank or dash (the dash is used to help me visually line up the elds during data entry).

### I.1.6.1 Byte 1 (Coarse type)

The coarse type allows us to divide the catalog into payloads, rocket stages, and debris. We consider two kinds of debris: components, which are subsystems of the parent object, usually but not necessarily designed to separate, and fragmentation debris, pieces resulting from an object breakup (propellant explosion, weapons test, self-destruct, collision, insulation blanket separation).

Value	Meaning
P	Payload (for orbital attempt)
C	Component
R	Launch vehicle stage
D	Fragmentation debris
S	Suborbital payload (e.g. sounding rocket payload or missile reentry vehicle)
X	Catalog entry that has been deleted (used in auxcat etc.)
Z	Spurious catalog entry (was in SATCAT, perhaps in TLEs, but there was no real object)

### I.1.6.2 Byte 2 (Type modifier)

The Byte 2 entries modify the Byte 1 entries (and are not independent of them). Here I tabulate the combined byte 1/2 values and their meanings. (cases where byte 2 is blank are not listed).

Byte 1-2 Value	Meaning
PA	Alias entry.
PH	Spaceship with humans aboard at launch.
SH	Spaceship with humans aboard at launch (suborbital).
SX	Suborbital, special cases not currently further defined
PP or CP or SP	Spaceship with pressurized cabin, but without humans at launch.
PX:	Not in standard list of satellites.
R1 to R5	Stage number for launch vehicle stage.
CC	Cargo placeholder for mass accounting.
CX	Component not to be included in certain standard lists
CD	Deployer for separately integrated payload

PA: The A (alias) modifier is used for special records representing a phase where the satellite is leased temporarily or jointly owned. This phase type is special in that its time period overlaps another phase. An example is object S23779 (Palapa C1, renamed HGS-3 in Nov 2000) From Dec 2000 to Jan 2003 its capacity was leased to

---

Turk Telecom which called it Anatolia 1. The HGS-3 entry is tagged with SatFlag equal to P (standard payload) while the Anatolia 1 entry covering an overlapping time period is tagged with SatFlag equal to PA to denote that it's a secondary or alias entry that may be ignored.

PP: The P modifier is used for spaceship test flights without crews, pressurized sections of cargo ships, and space station modules.

PX: The X modifier is used to denote 'non-standard payloads'. What is a payload and what is just a component? I take a broader view of 'payload' than most satellite lists do. Some examples of 'PX' types:

- Small passive calibration satellites. Some (e.g. the NRL Calspheres) are included as payloads in standard lists, but others (the ESO test objects released from Soviet Romb payloads) are not - they are given the X modifier. West Ford dipole clumps, however, are counted as components (C).
- Attached payloads. There is a subtle (and perhaps false) distinction between multiple experiments in a single spacecraft and multiple spacecraft permanently attached to each other. Agena spacecraft have a main payload attached to the front end of the rocket and small secondary payloads attached to the back end, integrated separately. I treat these as separate payloads with separate entries, and label the secondary ones with the X modifier.
- Recovery capsules. CORONA missions ejected film capsules with deorbit motors. For the brief moments when they were orbiting the Earth separately I consider them to be payloads.
- There are a few other cases, such as the E-8-5 Luna ascent vehicles and the LRVs.

CC is used for 'down cargo' for space stations returned to Earth or destroyed in cargo ship reentry. Note that we usually don't know the launch date of 'down cargo'.

The D modifier (CD) is used for separately integrated deployers. The D flag has been added to reflect the emergence of intermediary companies like Nanoracks and Spaceflight which sit between the payload owner and the launch provider and manage the integration of customer payloads. Note that byte 4 has a V value for 'deployer/clamp band' which is more general and does not imply a separate integration - it includes things like the CRRES canisters or the Shuttle PAM-D ASE. (Well, it's an interesting question whether those count as equivalent to a Nanoracks deployer, but I think the hardware and integration were done by NASA - I could be wrong.)

Objects with a D flag in byte 2 are usually not separate satellites but attached to a parent object (e.g. launch vehicle stage). They are therefore usually in the A (auxiliary) catalog.

### I.1.6.3 Byte 3 (Attach flag)

This flag describes why this object is attached to its parent object:

Byte 3 Value	Meaning
A	Permanently attached component or payload
F	Stuck attached by mistake
S	Expected to separate in future
T	Never flew free but transferred
I	Internal

F indicates that the object was intended to separate but failed to do so. S denotes that the object is expected to separate at a later date. T is mostly used for hardware that is transferred from the exterior of one object to another during a spacewalk or using robotic arms.

I is used for entries representing hardware that remains internal to one or more host spacecraft, possibly being transferred between them. Entries of this sort that I keep track of include EVA spacesuits not actually used on an EVA; cubesat dispensers used on ISS; and special entries used to do mass accounting of upward and downward space station cargo. In the future I'm considered adding entries for human space travellers, who would also be internal (either to a spaceship or a spacesuit).

#### I.1.6.4 Byte 4 (subtype flag)

This byte is used to categorize objects more finely than the byte 1-2 specification. It is useful for gathering statistics about different kinds of debris. Each value is usually only used with a subset of possible byte 1 values as listed below (however, these restrictions are not absolute).

Value	Meaning	Allowed B1 values
A	Payload adapter (e.g. SYLDA), support structures, interfaces	C
B	Battery explosion debris	D
C	Passive calibration satellites, test objects or chaff	P, C
D	Dummy satellite	P
E	Spacesuit on tethered spacewalk	P (PX)
F	Fairings and other covers	C
G	General, miscellaneous debris	C, D
H	Human spaceflight related	P, C
I	Impact (accidental collision)	D
J	Anomalous debris (insulation, soft material, ablated material)	C, D
K	Possible solid motor slag	D
L	Separated from vehicle after landing (rovers, etc)	P, C
M	Jettisoned motor or tank	C
N	Nuclear reactor core or coolant blob	C, D
O	Unknown debris released at orbit insertion	
P	Propulsion related, residual-propellant breakup	D
Q	Aerodynamic breakup at low perigee	D
R	Reentry vehicle	P
S	Subsatellite or subpayload	P
T	Ejected section of payload	C
U	Untethered EVA	P (PX)
V	Ejection mechanism (deploy canister, clamp band)	C
W	Weapons test, ASAT debris	D
X	Debris of unknown nature	C, D
Y	Despin (yo-yo) device	C
Z	Breakup debris from on-board destruct device	D

Note that code K used to be used for interstages but that meaning has now been merged with code A.

#### I.1.6.5 Byte 5 (orbit flag)

This flag is used to note special cases related to the object's trajectory. The flag is blank for normal SATCAT entries except for the deep space ones.

Value	meaning
D	Deep Space or escape
E	Destroyed in pad explosion
F	Failed to reach orbit
L	Active on planet surface during this phase
M	Missing from SATCAT by mistake (EXPRESS, IXV)
O	Orbital-Energy but Non-Orbit
P	Partial orbit - reached legit orbit but deorbited after less than 1 rev
R	Reentry orbit: objects that were attached and separated in post-deorbit-burn suborbital trajectory
S	Near-Orbit (marginally suborbital)
T	Transient orbit - separated just (perhaps seconds) before deorbit
V	Escape energy but not deep space
X	Extra catalog entry for extraterrestrially launched object
Z	Launch from extraterrestrial object, recataloged with new D series number.

#### I.1.6.6 Byte 6 (human spaceflight/special group flag)

This flag is present to support easily identifying all objects in the given categories, such as all satellite deployments from ISS. As such it serves a somewhat different purpose from the byte 2 values. At the moment I've only filled in values for space stations and Shuttle. 'Station' refers to any space station, or indeed any composite space object.

Value	meaning
I	Station program, general
C	Station major non-module component
D	Station deployable subsatellite
E	Station EVA related equipment
G	Pseudo-entry used for station generic cargo mass accounting
M	Station module
S	Space Shuttle program or Shuttle payload or component
T	Piece of visiting vehicle
U	Visiting vehicle or rocket stage deployed satellite
V	Station visiting vehicle

#### I.1.6.7 Byte 7 (UN registration flag)

This flag notes issues with UN registration for objects that are not standard payloads. Standard payloads (Byte 1-2 = P) should be registered, and the presence of a UNReg entry in the corresponding payload catalog tells you if they are or not (as of the last time I checked the UN site, at least). Non-standard payloads (Byte 1-2 = PX, see the byte 2 discussion) are more complicated. I have attempted to decide whether standard practice implies they should have been registered based on comparison with similar payloads.

Value	Meaning
U	Is, or should be, UN registered even though not a standard payload.
X	Was UN registered but should not have been.

For example, object A06499, the Canadarm-2 on the ISS, is not a standard payload and has no SATCAT entry. Nevertheless it was registered with the UN. A05668 Fasat-Alfa was a satellite that failed to separate from its parent

---

satellite. It doesn't have a separate SATCAT number from its parent S23657 Sich-1, so it is a 'PX' nonstandard payload; but it was registered by Chile, while Sich-1 was registered by Ukraine. Byte 7 is set to U.

Object A05597 EXPRESS completed several orbits of the Earth. It is a 'PX' nonstandard payload because the US tracking system failed to catch it, and it doesn't have a SATCAT number. Nevertheless Germany should have registered it with the UN and did not. Byte 7 is set to U.

On the other hand, A06874 Celestis-04 Error was registered with the UN but should not have been, since it was removed from the rocket before launch and never got to space. Byte 7 is set to X.

Object A07634 ELC-1 is a logistics carrier launched on the Shuttle and later attached to the ISS. Although the US has usually registered ISS pressurized modules, other similar minor ISS components (such as the other ELCs and the major truss segments) have not been registered, so for consistency ELC-1 shouldn't have been registered either. Byte 7 is set to X.

### I.1.6.8 Byte 8 (Failure flag/Constellation status flag)

An asterisk in this field records which rocket stage was to blame in an orbital launch failure. An asterisk in byte 8 says that this object was, broadly speaking, the culprit.

For a debris object, a numeric value in this field (1,2, etc) groups objects in a particular debris cloud for a launch which has multiple associated debris events. (I have only used this a few times.)

Other values indicate different kinds of payload failure (or success) and have been added to support analysis of the Starlink constellation.

Value	Meaning
*	This object was the one that failed during launch.
A	Satellite ascending: orbit raising to op orbit (or lowering from high drift orbit)
D	Satellite in plane drift orbit
F	Satellite failed early in mission, before reaching operational orbit ("screened")
G	Satellite retired to a graveyard orbit of some kind
L	Satellite removed far from operational constellation by lowering or raising orbit
M	Satellite failed in operational orbit and is undergoing uncontrolled decay - non maneuverable
O	Satellite is active in operational orbit
R	Satellite reentered after active orbit lowering
S	Satellite was used for special tests outside of main constellation
T	Satellite removed slightly (and possibly temporarily) from operational constellation by lowering or raising orbit a little
U	Satellite apparently malfunctioning, held in intermediate orbit for debugging?

### I.1.6.9 Byte 9 (ID flag)

This flag notes problems with the identification of the object.

Value	Meaning
?	The association of this satellite with this catalog number is a guess because JSpOC has not yet assigned a name. ID may change in future.
+	Starlink filing with FCC reports this satellite is out of service but could still maneuver, at the time of filing. Starlink filing with FCC reports this satellite is out of service and can not maneuver.
m	Multiple objects. This entry is a placeholder for a known debris event where no debris has yet been cataloged by DoD.
C	US government orbital data for this object are secret.
c	Older US government orbital data for this object were secret, but current data is public.
U	This object is a cargo item on ISS (or other station) and has been assigned to a likely cargo launch but the actual launch for this object is not known.
D	This object is a cargo item on ISS (or other station). The return date is uncertain and I've made a guess at which ship it went down on.
X	We don't know which launch this object is from, so the launch date is unknown (and other parameters may also be unknown).
s	Disagreement between TLE and SupTLE data (true for S45139)

### I.1.6.10 Byte 10 (Annotation flag)

This byte is used to control display options in certain software associated with the database. It should be ignored by other software.

At present, possible values of this byte are r,g,b,c,m,y,k indicating colors chosen for data associated with the specific satellite in automated plots, e.g. of altitude vs time.

### I.1.6.11 Byte 11 (Group control flag)

This byte is used to include or exclude objects from the debris clouds in the debris cloud catalog.

Value	Meaning
+	Object included in debris cloud analysis
-	Debris object not counted as part of debris cloud

## I.1.7 Phases and Status Values

Each entry in the General Catalog represents a time period or phase in the flight history of an object. The !b status value describes the status of the object at the end of the phase. Typical values of the status are 'O' (still in orbit) and 'R' (reentered). But it can get a lot more complicated.

---

### I.1.7.1 Phases

Each time an object transitions to another state (undocks, is attached to something, reenters, changes which body it is orbiting, etc.) marks the beginning or end of a **phase**. Most objects in GCAT have only a single phase - they separate from an object (launch vehicle) and then are either still in free flight or have reentered. However, some objects go through many phases.

The phase is defined by a set of fields in the object catalog entry.

Field	Symbol	Format	Description
Parent	P	EJCAT/Body	the parent can be an extended JCAT ID (EJCAT) or a body name.
SDate	t1	VagueDate	the phase start time. This can be the time the object separated from the parent EJCAT or the time the object departed the parent body's gravitational sphere of influence (SOI)
Primary	C	Body	the name of the central body for this phase
DDate	t2	VagueDate	the phase end time
Status	S	Phase Status Code	a code describing the event that ends the phase
Dest	D	Location/Body/JCAT	'destination', a string whose definition depends on the Status value. It can be empty, a Location, a body, or a JCAT.

Also relevant is *te*, the orbit epoch ODate, mentioned in a few cases below.

The symbols in the table above are used in the discussion below for conciseness.

A **location** can be expressed as a string (uncontrolled text, e.g. 'W Atlantic') or as longitude/latitude coordinates (e.g. 74W 22S). The Dest field may be blank if reentry location is unknown.

The different kinds of phases are defined by the Status field. They are given in a somewhat arbitrary order that makes sense to me, and grouped by what kind of Dest field is used. The state of an object includes its 'externality' - is it free, attached to a parent object externally, or is it inside its parent object. This externality is also described in the following table defining the different Status codes. The table assumes (in the interpretation of t1 and t2) that P is a EJCAT rather than a body. If P is a body then t1 represents the time the object went from P's SOI to C's SOI; if D is a body then t2 represents the time the object went from C's SOI to D's SOI.

(Added 2021 Oct.) For cases where a vehicle is reused in a new launch (e.g. Space Shuttle Orbiter), the REFLT status is used to connect the objects. For example, the Space Shuttle OV-102 Columbia flew on mission STS-1 as orbital launch 1981-034, catalog S12399, piece designation 1981-034A. When it flew again on STS-2, NORAD gave it a new launch number 1981-111, catalog number S12953, and piece designation 1981-111A. Understandably the NORAD (now Space Force) tracking system cannot know from tracking data that the objects are the same vehicle - but historians do. I add an extra phase to S12399 (STS-1) after the landing, with zero duration, status REFLT, and dest equal to S12953, to signal that S12399 later got relaunched as S12953. Note that only a few entries of this kind have been added at the time of this writing.

I acknowledge that there is a bit of a 'ship of Theseus' problem here: is the orbiter that flew on STS-93 really the 'same object' as the one that flew STS-1?

The case of re-launches from other worlds is slightly different, in that Space Force does NOT assign a new catalog number, but I do - when the launch is from a world, not a small rock. For Apollo 11, three objects get new catalog numbers: the LM 5 Eagle ascent stage and the two EVA suits. EVA suit A7L-056 was given auxiliary catalog A01625 for its launch from Earth (launch designation 1969-059). On reaching deep space aboard Eagle it is given designation D00265. The last A01625 phase has status DSA with dest D00265 to tie the two together. The suit retains its D00265 designation through the lunar surface EVAs. Then it has a phase with the REFLT tag reassigning it to a new catalog number D01053 associated with a new launch, 1969-U01, corresponding to the launch of Eagle from the lunar surface. This follows the spirit of what NORAD did with STS-1 - when relaunching the same thing it gets new launch designations and catalog numbers - even though NORAD does not actually do this when the launch is not from Earth. Suit A7L-056 retains the new D01053 catalog number and 1969-U01 launch designation through its landing in the Pacific aboard D00273/1969-059A Columbia.

---

For the actual extraterrestrial re-launching itself, I retain the 'LO' status tag used previously but add a dest value. 'LO' should now be considered as equivalent to REFLT for such cases. Thus, for Eagle's ascent stage we have: launched from Earth as 1969-059C, catalog S04041. Reached deep space and reassigned as 1969-059C, catalog D00274, via a DSA status tag to connect the catalog numbers. Relunched from the Moon as new launch 1969-U01, catalog D01052. The final D00274 phase has status LO with dest D01052 to connect it to the new catalog number.

For 'launches' (departures) from low gravity objects that I don't count as worlds, I don't give new launch designations. I think of it more like an undocking in such cases! In these cases, the LO status tag does not have a new catalog number in the Dest field.

In earlier versions of the catalog, I did not distinguish between planetary flybys and orbital missions. Both used the 'EO' take for a swich of sphere of influence. For an orbital mission, however, the phase within the planetary sphere of influence includes three sub-phases: hyperbolic approach from sphere of influence to orbit insertion, elliptical bound orbit phase, and (hyperbolic) departure from orbit escape to sphere of influence (or to impact/landing).

In versions prior to 1.4, suborbital objects were given status 'R'. However their reentry, although it doesn't involve a deorbit burn, is at a predictable time and targeted location, which is importantly different from uncontrolled reentries of orbital objects. The new status value 'S' is now used for suborbital targeted reentries and also (a bit more questionably) for launch failures. The 'LF' code for failed landing has not been used generally - some 'D' should really be 'LF'.

Status value	Description	Interpretation	Externality
<b>Cases with t2 and Dest both empty</b>			
O	In orbit	Sep from P at t1, still in free flight	Free
AO	Attached in orbit	Attached to P from t1 to present	External
AO IN	Attached inside	Inside P from t1 to present	Internal
UDK	Undocked	Docked to P from t1 to t2, sep from P at t2	External to fr
REL	Released	Attached to P from t1 to t2, sep from P at t2	External to fr
DEP	Deployed	Same as REL but for objects on planetary surface	External to fr
TO	Takeoff	Launch from C surface (C is a small body, not a world)	Free
TOA (was ALO)	Attached at takeoff	Attached to P from t1 to t2 including at launch from C surface.	External
OX	In orbit (probably) but lost	As O, but no recent tracking data	Free
<b>Dest is always blank but t2 is not</b>			
E	Exploded	Sep from P at t1, free in orbit until breakup at t2. Next phase of this object is a debris fragment.	Free
N	Renamed	In orbit from t1 to t2, name or owner changed at t2. Next phase reflects new name and owner	Free
NA	Renamed attached	Attached to P from t1 to t2, name or owner changed at t2. Next phase reflects new name and owner	External
LEASE	Lease	Temporary lease from main owner from t1 to t2. Sat-Type code is PA.	Free
<b>Dest is a location on C, or C itself, or blank (see also 'Dest is a body name' b</b>			
S	Targeted suborbital entry/impact	Sep from P at t1, crashed or destroyed in atmosphere at t2 at end of launch trajectory	Free
R	Reentered	Sep from P at t1, destroyed in C's atmosphere at t2 after natural decay	Free
D	Deorbited	Sep from P at t1, destroyed in C's atmosphere at t2 via active deorbit maneuver	Free
L	Landed	Sep from P at t1, landed or splashed down on C's surface at t2	Free
LF	Failed landing	Intact landing intended but actually destroyed on impact	Free
AS	Suborbital reentered attached	Attached to P from t1 to t2 when P reentered	External
AR	Reentered attached	Attached to P from t1 to t2 when P reentered	External
AR IN	Reentered inside	Inside P from t1 to t2 when P reentered	Internal
AL	Landed attached	Attached to P from t1 to t2 when P landed	External
AL IN	Landed inside	Inside P from t1 to t2 when P landed	Internal
TX	Transmission ended	Operated on C's surface from t1 to t2	Free
F	Failed	Sep from P at t1, crashed or destroyed at t2 during launch failure	Free
AF	Failed attached	Attached to P at all times until it and P crashed or destroyed at t2 during launch failure	External or in nal.
<b>Dest is a JCAT from D catalog (deep space). JCAT ID used in deep space catalog f</b>			
DSO	Deep space	Sep from P at t1, passed deep space boundary at t2.	Free
DSA	Deep space attached	Attached to P since t1, passed deep space boundary at t2.	External
DSA IN	Deep space inside	Inside P since t1, passed deep space boundary at t2.	Internal
LO	Liftoff	Launch from C surface (C is a world but not Earth), catalog reassigned to dest	Free
LOA	Reflight attached	Launch from C surface (C is a world but not Earth) aboard parent object, catalog reassigned to dest	External or In nal
<b>Dest is a JCAT from the main catalogs (not from D catalog)</b>			
DK	Docked	Sep from P at t1, docked with D at t2	Free to Extern
GRP	Grappled	Sep from P at t1, docked with D at t2	Free to Extern
ATT	Attached	Was attached to P at t1, then attached to D at t2	External.
TFR	Transfer	Inside P at t1, moved inside D at t2	Internal
TFR E	Transfer external	Inside P at t1, moved to exterior of D at t2	Internal to E nal
TFR IN	Transfer in	Outside P at t1, moved to interior of D at t2	External to In

For case C (Collision) the collision can result in the destruction of the object, in which case there is no subsequent phase; or the object can survive, in which case t2 starts a new phase. If object A collides with object B, there is a C status for each of the objects A and B. That is, A has a phase that ends with 'A collides with B', and B has a phase that ends with 'B collides with A'. If A survives, B is the parent object for A's next phase, and vice versa.

For cases R, D, AR, AR IN: if C has no atmosphere, t2 is the time of impact on C's surface. Natural decay includes orbit perturbation due to mascons, and direct impact without first entering bound orbit.

For cases DSO, DSA, DSA IN; the object is considered to have left the main part of GCAT at t2. Its old JCAT ID no longer applies and the Deep Space Catalog JCAT ID is used for further phases of its history.

For case LO, when taking off from a world a new launch designation and catalog number are assigned - it is treated as a new launch. For case TO, when taking off/departing from a small body, I don't consider it a new launch and no reassignment is made.

For case EVA RP, P and D are usually the same airlock. The phase may involve moving outside airlock and returning ('spacewalk'), but sometimes the 'EVA' may be entirely internal, working inside the depressurized airlock for the duration. Sometimes I use the phrase 'depressurization activity' rather than 'EVA', since the initial E is not necessarily applicable.

The cases OI, OE, EN, EO and EAO are only used in the Deep Space Catalog and the heliocentric and lunar-planetary registers.

## I.1.8 Launch Success Fractions

The practice, of which I and others have long been guilty, of evaluating launch vehicle reliability based on a simple pass/fail value for each launch is rather a blunt instrument. To try and do a bit better, I have added a **launch success fraction** in some cases.

In the LaunchCode field of the launch lists, I take a rather old-fashioned view of success and failure. Nowadays, if a commercial satellite launch vehicle fails to deliver all its customer payloads to the correct orbit in working order, the launch is considered a total failure. In the 1950s, however, a US government launch that got only a few metres off the pad might still be considered a 'partial success', for example because it demonstrated the correct functioning of the engine ignition system and the ability of the rocket to fly in vaguely the right direction.

When you're assessing the capability of launch vehicles over decades and comparing those from new space players and established spacefarers, this older approach is actually helpful. In 2012 I introduced the following scheme.

For pass/fail purposes I consider a score of less than 0.75 to be a failure; one could argue for lowering that boundary a little bit.

For launches with a single payload, or multiple equal-priority payloads, I give:

- full success	1.00	
- orbit usable but not nominal	0.75	
- orbit but not a usable one	0.40	
- payload failed to separate or fatally damaged by LV	0.25	(even if good orbit)
- orbit not reached	0.00	(or reentry after circa 1 orbit)

For missions with primary (P) and secondary (S) payloads, a rough scaling to give the P 3 times the weight of S -

- full success	1.00
- S off-nominal orbit	0.95
- S unusable orbit	0.85
- S failed to sep	0.75
- P off-nominal orbit	0.55
- P unusable orbit	0.30
- P failed to separate	0.10

There's still some subjectivity here, and I've allowed myself to assign intermediate values, e.g. when an orbit is only slightly off-nominal. Now obviously scores of 0.40 or less are going to mean an unhappy customer, but I think it's still worth distinguishing from complete failure to orbit a it usually indicates a vehicle which is 'close' to working in contrast to some vehicles which never make it beyond first or second stage burn.

In my initial implementation in 2012, the scores assigned that differ from 0.0 and 1.0 were:

Score	LaunchCode	Launch (Launch desig, vehicle)
0.25	OF25	96-061 Pegasus
0.40	OF40	63-021 Thor Agena, 67-032 Proton. 76-062,76-088, 80-031,
0.45	OF45	04-050 Delta 4H (primary payload medium-bad orbit, second
0.50	OF50	01-029 Ariane 5/V142
0.75	OS75	97-057 PSLV, 97-066 Ariane 502, 07-027 Atlas V/NROL-30
0.80	OS80	00-048 Delta 3, 01-015 GSLV (somewhat off-nominal orbit)
0.85	OS85	12-054 Falcon 9 (primary perfect, secondary unusable)

## I.1.9 Orbital Categories

The following table gives the abbreviations I use to summarize different orbital categories (notably, in the OpOrbit field of the object catalogs.) LEO is (the upper part of) Low Earth Orbit; LLEO is Lower LEO, below 600 km. GEO is Geosynchronous Earth Orbit.

'Height'  $h$  is defined as geocentric semi-major axis minus Earth equatorial radius:  $(a-6378.0 \text{ km})$ ; i.e. average of conventional perigee ( $h_p$ ) and apogee ( $h_a$ ) heights. Heights are in km, inclination in degrees.

One common conventional upper boundary of LEO is a 2 hour period (and it's enshrined in code as part of the SGP4 model.) Orbital period makes the most sense for defining boundaries between there and GEO, while height makes the most sense for the lower boundaries. This makes the definition scheme a bit patchwork - sorry.

Prior to release 1.3 (Sep 2022) I used a 2-hour period (1681 km altitude) as the upper boundary of LEO. I now use 2000 km altitude, which has become the more common usage in recent years.

Code	Name	Period (hr:min)	Height (km)	Inclination (deg)	Eccentricity
ATM	Atmospheric		ha below 80		
SO	Suborbital		hp below 0, ha above 80		
TA	Trans-Atm.		hp from 0 to 80, ha above 80		
LLEO/E	Lower LEO/Equatorial		h 80 to 600	0 to 25	
LLEO/I	Lower LEO/Intermediate		h 80 to 600	25 to 85	
LLEO/P	Lower LEO/Polar		h 80 to 600	85 to 95	
LLEO/S	Lower LEO/Sun-Sync		h 80 to 600	95 to 104	
LLEO/R	Lower LEO/Retrograde		h 80 to 600	104 to 180	
LEO/E	Upper LEO/Equatorial	Up to 2:00	h 600 to 1681	0 to 25	
LEO/I	Upper LEO/Intermediate	Up to 2:00	h 600 to 1681	25 to 85	
LEO/P	Upper LEO/Polar	Up to 2:00	h 600 to 1681	85 to 95	
LEO/S	Upper LEO/Sun-Sync	Up to 2:00	h 600 to 1681	95 to 104	
LEO/R	Upper LEO/Retrograde	Up to 2:00	h 600 to 1681	104 to 180	
MEO	Medium Earth Orbit	2:00 - 23:00			0.00-0.50
HEO	Highly Elliptical orbit	4:03 - 23:00			0.50-0.92
HEO/M	Molniya	11:30 - 12:30		62.0 - 64.0	0.50 - 0.77
GTO	Geotransfer	10:00 - 12:30		0.0 - 85.0	0.50 - 0.77
GEO/S	Stationary	23:55.5-23:56.5		0.0 - 3.0	0.00 - 0.01
GEO/I	Inclined GEO	23:55.5-23:56.5		3.0 - 25.0	0.00 - 0.05
GEO/T	Synchronous	23:55.5-23:56.5		0.0 - 180.0	0.00 - 0.85
GEO/D	Drift GEO	23:00 - 25:00		0.0 - 3.0	0.00 - 0.05
GEO/SI	Inclined GEO	23:55.5-23:56.5		3.0 - 25.0	0.00 - 0.05
GEO/ID	Inclined Drift	23:41 - 24:11		3.0 - 25.0	0.00 - 0.05
GEO/NS	Near-sync	23:00 - 25:00		0.0 - 180.0	0.0 - 0.85
VHEO	Very High Earth Orbit	Above 25:00		0.0 - 180.0	0.0 - 1.00
DSO	Deep Space Orbit		h above 145688 to 318200		0.0 to 1.0
CLO	Cislunar/Translunar		h from 318200 to 1.5 million		0.0 to 1.0
EEO	Earth Escape		h less than 1.5 million		Above 1.0
HCO	Heliocentric		h more than 1.5 million		Heliocentric e
PCO	Planetocentric		Central body not Earth or Sun		
SSE	Solar System Escape				Heliocentric e

## I.1.10 Uncataloged ('U') Launches

### I.1.10.1 The U designation

In the (See launch designations) section we mention the 'U' entries. These are launches for which I assign designations for the form 1969-U01, etc. They are launches which are not in the usual lists of orbital launches, but which are close to making the cut for various reasons, and most of them are pretty interesting.

Orbital launches usually have international designations ('COSPAR designations'). Assignment of these designations was delegated in the early 1960s by the UN COSPAR to the World Data Center A for Rockets and Satellites, who at some point further delegated it to NORAD, today in the form of the US Space Force 18th Space Control Squadron.

The traditional rule was that any launch from the Earth which resulted in an object completing one or more orbits of the Earth would receive a designation. This rule has not always been followed.

I assign U designations for several categories of launch that I consider interesting:

- 'Skipped launches': Launches which should have received international designations but did not, either because the US failed to track them or because the rule was not followed.

- 
- 'Marginal orbit': Attempted orbital launches which failed to reach a sustained orbit, but fell just short; typically perigee between -500 km and +100 km. Since the exact orbit attained is often uncertain, I have tended to be inclusive when deciding whether to assign such launches a 'U' rather than an 'F' designation. You can think of this category as a way to pull out 'interesting' launch failures that were really close to succeeding, as opposed to ones that blew up just above the pad.
  - 'Suborbital with orbital energy': Suborbital launches that have a high apogee (more than a few thousand kilometres) have a total energy (kinetic plus potential) that is greater than a low orbit satellite, in contrast to the vast majority of suborbital sounding rocket and missile flights which are well short of orbital energy. Thus, these are 'interesting' suborbital launches than are in some sense close to being orbital.
  - 'Reentry with orbital energy': suborbital launches with stages that fire their payload down fast into the atmosphere to test reentry behaviour. In some cases these even have escape velocity, but going in the 'wrong' direction. They may only traverse a small segment of the indicated orbit; for example the orbital parameters of Meteor 4/5 have a large apogee but the vehicle didn't ever get to that apogee, flying on a small segment of the downward arc of the orbit with a maximum actual altitude of 110 km.
  - 'Extraterrestrial launches': launches from worlds other than the Earth. (So far, that's just the Moon). 'Worlds' here means large (self-gravitatingly round) bodies; departures from comets and small asteroids are considered equivalent to undockings rather than launches and are not given separate launch designations.

For convenience, here is an annotated table of all the U launches. 'Actual Apo' indicates the actual maximum height above Earth reached. 'Orbit Peri' and 'Orbit Apo' define the orbit that the spacecraft was on for at least a few moments, even if they did not reach either orbit extreme. Recall that negative apogees represent hyperbolic (above escape velocity) trajectories, albeit in this case heading downwards into the atmosphere.

The C3 value, usually used for Earth escape launches, is a measure of the orbital binding energy per unit mass, in  $\text{km}^2/\text{s}^2$  or (equivalently) MJ/kg; the SpE value is the total kinetic plus potential energy per unit mass, in the same units; the two are not independent, as  $\text{SpE} = 0.5 * \text{C3} + 62.5$ . C3 is negative for objects bound to Earth and positive if they have escape velocity; SpE is always positive and I find it more intuitive for the marginal-orbit cases.

## I.1.11 Analyst Objects

In the derived catalog 'currentcat' I have added about 700 objects with 'C' prefixes. These are debris objects tracked by the US Space Force which they have not identified with a specific launch.

### I.1.11.1 Analyst Objects in the Space Force Catalog

The main, public US Space Force catalog has a running catalog number starting with 1 (Sputnik 1 rocket stage) and going to currently somewhat over 51000.

The criteria for a previously undetected debris object being added to the catalog are traditionally:

- Object remained in space for more than one full orbit
- Object's orbit is well determined and followed over a period of time (many orbits). I will refer to this as it being a 'persistent object', as opposed to radar tracks that are not seen again. (For astronomers: This is analogous to the difference between a minor planet with a provisional designation and one with a permanent asteroid number.)
- Object is identified as being from a specific launch, so that it can get an 'international designation'

The Space Force also generates orbital solutions for objects which do not yet meet these criteria, but might later get added to the catalog. These are called 'analyst objects' (the data will be studied by analysts for possible later identification). Historically these are assigned fake catalog numbers between 80000 and 90000 (and possibly between 70000 and 80000, although the orbital data for those has not generally been released). More recently, objects detected by the Space Fence have been given numbers starting at 270000.

A few datasets of the analyst object TLEs became public (possibly inadvertently) over the years, and then in 2020 a subset of analyst TLEs started being regularly released by 18SPCS on Space-Track.org.

To distinguish the analyst objects, I add them to my supplementary CSOCAT catalog (which also contains objects from other sources such as hobbyists). CSOCAT catalog numbers in the ranges 80000-89999 and 270000 upwards are reserved for US Space Force analyst object TLEs.

These objects fall in several categories:

- Assorted TLEs: analyst catalog numbers with several TLE sets referring to several different objects in entirely different orbits. These numbers are apparently reused at will and do not refer to a single persistent object.
- Fake (Search) TLEs: TLEs which appear to be associated with prelaunch estimates of a known object rather than being based on actual tracking data.
- Poorly tracked objects, with only one or two TLE sets, and those from many years ago.
- Old, retired analyst objects: analyst catalog numbers with several TLEs in my archive, but none referring to recent epochs. In particular, a lot of objects in the 1994 and 1998 analyst datasets available to me don't appear in the modern (2020 onwards) TLE data releases. I have assigned them status OX (lost), but in many cases it's possible they have been moved to the main catalog with a new catalog number. I have identified a handful of cases like that, but haven't worked to make systematic cross-identifications.
- Persistent analyst objects: analyst catalog numbers for which the TLEs since 2018 clearly refer to one specific object (the orbit changes slowly) and which continue to get new updated TLEs in the past year or so.
- Space Fence objects: the objects with catalog numbers above 270000. All of these (with a handful of exceptions) appear to be persistent analyst objects.
- Unreleased analyst objects. The Space-Track.org 'Space Scoreboard' says that there are (as of Feb 2022) 17600 analyst objects, many more than data is being released for.

---

### I.1.11.2 Objects in the CurrentCat

Only the ‘persistent analyst objects’ are really of interest, as real well-tracked objects which would be in the main catalog if they were associated with a known launch. As of Feb 2022 there are a little under 700 of these. This is just a few percent of the number of tracked debris objects in orbit, and a small number compared to the 17600 such objects reported to exist by 18SPCS.

All the analyst objects for which I have any data are included in the Complementary Catalog ‘csocat’. Use that data with care, since they include objects which are not necessarily real, and ones which have been reassigned with new numbers elsewhere.

The 700 robust ‘persistent analyst objects’ are now included at the end of the derived product ‘currentcat’ so that they can be used in statistical studies.

### I.1.11.3 Tentative Identifications of Analyst Objects

I have attempted to identify these analyst objects.

- In some cases one can infer the parent launch with fairly high confidence - for example objects from the 1965 SNAPSHOT launch which have distinctive orbital parameters.
- In other cases one can only identify them as being from one of a handful of launches - there is a debris cloud at high inclination which is dominated by debris from three different Delta rocket stages that exploded in Dec 1973 (Delta 98), Aug 1975 (Delta 104), and Dec 1977 (Delta 126). You can be pretty sure that certain debris objects belong to one of those three launches, but you can’t tell which. For now I have arbitrarily picked one of the launches to assign to the objects but indicate the ambiguity in the object name.
- In still other cases, notably for LEO sun-synchronous objects and many Molniya orbit and geotransfer orbit objects, there are too many possible parent launches to make a specific identification. In these cases I do not assign an international designation and give the object a generic name like ”Unknown SSO debris”.

In future I hope to take a more rigorous approach by creating new designations for specific debris clouds.

## I.1.12 Nomenclature codes (work in progress)

Satellites use a variety of nomenclature schemes and many satellites have multiple names. The GCAT object catalogs provide a primary post-launch name (‘Name’), a (often pre-launch) payload name (‘PLName’) and optionally a comma-delimited list of further alternate names.

For some purposes it is useful to flag which nomenclature scheme is being used for which name. In order to do this, GCAT introduces a ‘nomenclature code’ used to tag specific names. This code is usually a one or two letter string, but I reserve the right to make the strings longer in future.

The NomCodes can in principle support use cases such as:

- Print only the manufacturer name
- List all satellites with an early NASA ‘S-45A’ style designation
- Omit NRO mission names

However, that would require the NomCodes to be entered for all satellites. The user is warned that as of mid 2021, only a handful of satellites have NomCodes assigned. The intent is that NomCodes will be added as time goes on, but completion of that project is likely to take years.

---

### I.1.12.1 NomCodes file

Valid nomenclature codes are listed in the (See NomCodes ) file.

### I.1.12.2 NomCodes in object catalog AltNames field

Nom codes are included as colon-delimited suffixes in the AltNames field. For example, the AltNames field might be

```
Zenit-6 No. 7L:RC,11F645 No. 76038-407:RB
```

This says the object has two alternate names:

```
1: Zenit-6 No. 7L
2: 11F645 No. 76038-407
```

The first one has nomenclature code RC, and the second one has nomenclature code RB. The RC code tells us that that name is a Soviet/Russian manufacturer name.

These NomCode suffixes are not currently supported in the Name and PLName fields. Instead, NomCode values for those fields may be listed at the beginning of the AltNames field, as for example:

```
:C,:RD,Zenit-6 No. 7L,11F645 No. 76038-407:RB
```

Parsing this string, we see that the first comma-delimited item is a NomCode (because it has a colon, which is treated as a special character) without a name prefixed to it. So, it is interpreted as a NomCode for the Name field. The second comma delimited item is also a NomCode with no name prefixed, so it is a NomCode for the PLName field. We then go into the regular list of AltNames. Note that in this example the first AltName doesn't have a NomCode. Some entries in an AltNames list may have a NomCode and others may not.

Correspondingly, if the first entry in the AltNames list has a non-empty name section, then there are no NomCodes defined for Name or PLName.

The catch is that there are two satellites which actually have colons in their names (Eu:CROPIS and RE:X xing). Colons may occur in the Name and PLName field, but are not allowed in names in the AltNames field. That's ugly, I know.

## I.1.13 Launch Service Codes

The Launch Service codes are provided in the Groups column of the launch lists, for orbital launches only.

I apologize for the overloading of the Groups column with totally different meanings in the orbital and suborbital cases. This denormalization was done purely for reasons of compact formatting in my internal representation.

The launch service code encodes the type of launch service (govt., fully commercial etc.) and customer (govt./commercial). To be used for statistical analysis of commercial launch activity. The intent here is to capture some nuance around 'commercial launches' - is the money really coming from commercial activity or is it just more government space investment with a different contracting model?

The launch service code is of the form

LST

or

LST/CT

or

---

LST/CT+CT

where LST is the **launch service type** and CT is the **satellite customer type**, as listed below.

The LST codes (launch service types) are:

LST Code	Launch Service Type	Default CT
G	Government rocket	G
CG	Commercial rocket operated on behalf of govt.	G
CO	Commercially operated government-developed rocket	C
CX	Commercial rocket and payload but end customer is govt	C
C	Fully commercial rocket	C

The CT codes (satellite customer types) are

CT code	Customer type
G	Government (of the rocket operator's country)
OG	Other government (foreign to the rocket operator)
C	Commercial

We distinguish between the government of the rocket operator's country and other governments. For example, Thor Delta is a US rocket so if it carries a US govt payload that's CT = G, but if it carries a Canadian govt payload that's CT = OG. Special cases include ESA/Arianespace rockets, where ESA, the EU, and individual ESA member state governments all count as 'G'; for Rocket Lab both US and NZ count as 'G'.

If the CT is the default CT for that LST, it can be omitted. Up to two different CTs can apply to a different launch.

Example 1: G - Government rocket with govt payload

Example 2: CG/OG+C - Commercial rocket operated on behalf of govt, carrying payload(s) for another govt and commercial payload(s).

## I.1.14 Launch Profile Codes

The launch profile codes are provided in the Category field of the launch lists, for orbital launches only.

This field encodes the target orbit type (LEO, GEO etc.), the upper stage(s) disposal mode, and the number of launch vehicle related debris objects generated during the launch phase (later stage breakups are not included). Note that the data in this field represent the intended result of the launch, not the actual result. It can be used to track the evolution of space debris mitigation practices used by launch agencies.

The format of the launch profile code is:

Sat XXX CC N

where XXX is the orbit code for the target orbit, CC encodes the planned upper stage(s) disposal mode, and N is the number of other debris objects planned to be left in orbit from the launch vehicle (not counting objects released by the payload, although there is some ambiguity in that).

The target orbit codes are:

Orbit code	Meaning
DSO	Deep space orbit (Earth orbit with apogee beyond 150,000 km)
EEO	Earth escape orbit
GEO	Direct geosync insertion
GTO	Geosync transfer orbit
HEO	Highly elliptical orbit (except MTO, MOL, DSO)
ISS	International Space Station
LEO	Low Earth Orbit (other than SSO, LSS, ISS)
LSS	LEO space station other than ISS
MEO	Medium Earth Orbit
MOL	Molniya orbit
MTO	MEO transfer orbit (with payload performing MEO circularization)
SSO	Sun-sync orbit
STO	Supersync transfer orbit (apogee more than 45000 km)
XO	Extraterrestrial launch (e.g. launch from lunar surface)

The next part of the launch profile code indicates what measures are taken to dispose of each upper stage which reaches orbit, or is close to reaching orbit. This section has one, two or three letters, depending on the number of upper stages reaching orbit.

Disposal codes are not included for extraterrestrial launches.

For example, OL means that one upper stage was left in orbit with no orbit change, and a second one was left in orbit with a perigee lowering burn carried out after payload deployment.

Disposal code	Meaning
A	Stage left in Earth orbit, but remains attached to payload by design.
B	Stage made depletion burn which boosted it to higher Earth orbit.
D	Actively deorbited to destructive reentry
E	Stage placed in Earth escape orbit
L	Small perigee lowering burn to reduce orbit lifetime (but not meeting criterion for P)
O	Left in Earth orbit for later uncontrolled reentry
P	Perigee lowered to 180 km or less for rapid decay, or stage left in orbit with that low a perigee to start with.
R	Recovered intact for possible reuse (so far, space shuttles only, considered as upper stages).
S	Stage left in marginally suborbital trajectory for targeted reentry on first orbit. Stages with perigees above -10

The S cases are typically ones involving disposing of a large core stage by leaving it slightly suborbital and making the payload or a small insertion stage complete the orbit insertion (for this purpose, the Shuttle External Tank is counted as a stage). This is a standard way of avoiding leaving a big stage with a non-restartable engine in low orbit, and is included to highlight this responsible strategy (and as a contrast to cases such as the CZ-5B).

Finally the number of other launch vehicle-related intentional debris objects is listed. Accidental debris, such as from upper stage breakups, is not included here. Typically the objects noted are tumble weights, multi-payload adapters such as Ariane Sylda5, or payload release hardware such as Starlink tension rods.

For example, 'Sat GTO SO 1' indicates that the launch was targeted for geotransfer orbit, that one stage was marginally suborbital and another was left in orbit for uncontrolled decay, and one additional debris object was left in orbit.

**Part II**

**Space Organizations**

## Chapter II.1

# The Space Organizations Catalog

### II.1.1 Introduction

In catalogs, review papers and databases describing or tabulating artificial satellites, space launches and other astronomical events, it is often necessary or useful to report the country of origin, owner organization, and/or manufacturer of the object of interest. This can be problematic as there is no standard way to refer to a particular organization. Organizations or parts of organizations are frequently sold, merge, or otherwise change their names, potentially concealing continuity in design of their spacecraft.

For my purposes, an ‘organization’ can be any named and spacetime-localized entity including

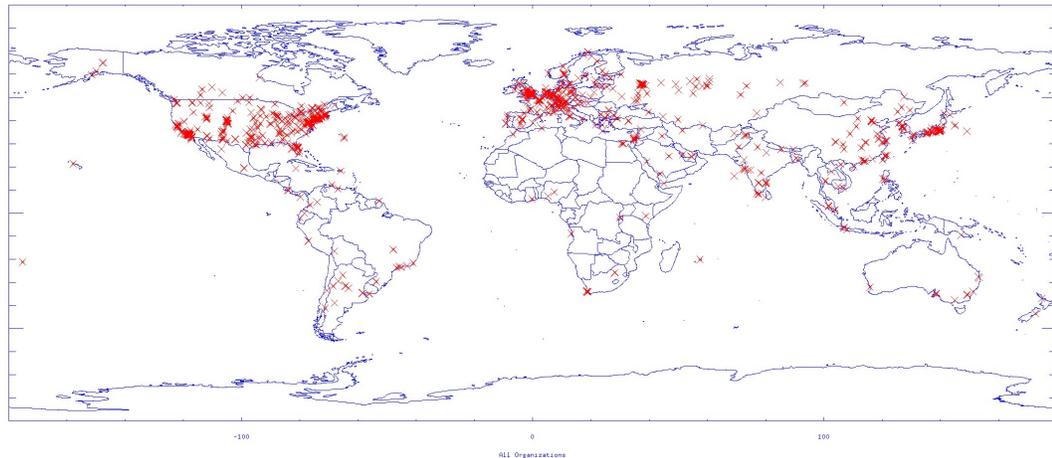

- A world or a region on a world - an ‘astronomical polity’ (AP)
- A country (nation-state) or autonomous political region (CY)
- An intergovernmental or supranational organization, used as if it were a country (IGO)
- An academic (A) or non-profit organization
- A business (B) entity, a corporation, company, or operating location thereof
- A civilian (C) or military/defense (D) government agency, base, or group

In this paper I present a scheme - the ‘Org Code’ - for referring to space organizations and a database of such organizations. The scheme and associated (See database) were developed to address this problem for the General Catalog of Artificial Space Objects (GCASO, McDowell 2020 in prep.), but I hope it will be found generally useful as no other comparable public dataset exists.

The organizations database generally includes only owner/operator and prime contractors for already-launched spacecraft, stages, stage main propulsion engines, etc., not subsystem level contractors, data analysis organizations, nor (with some exceptions) organizations involved only in missions whose launch is not yet imminent.

Although most documents describe satellite ownership and manufacture at the level of a headquarters parent agency or corporation (NASA, Boeing, Roskosmos, JAXA), I find it more illuminating to follow events at the level of a single operating location - an agency center like NASA-Goddard, or a factory/design organization like McDonnell Douglas/Huntingdon Beach (now Boeing). I assign a short alphanumeric code, the Org Code, to each such operating location.

Below: map showing geographic distribution of all organizations in the database (click for larger version)

## II.1.2 The Org Code

### II.1.2.1 Allowed characters

The GCASO Org Code scheme presented here uses a unique string of 1 to 8 characters to refer to an organization. Allowed characters are the digits 0-9, the ASCII upper case letters A to Z, and the dash (minus-sign). Some examples of the Org Code are: I-ESRO, SWRIB, B, 44FA2, IQ223, NASA.

### II.1.2.2 Code and UCode: Organization phases

We want to track the time evolution of an organization as it changes outward identity at the same location. Each change marks the start of a new 'phase' which gets a new **Org Code**, but also has an associated "**UCode**" (unified code) which is the same for all of the phases (and is usually, but not necessarily, the Org Code of the first phase). Note that each UCode is itself an Org Code.

For example, let us consider the Palo Alto, California location of Ford Aerospace. I assign this the UCode FORDA, with a series of phases:

Code	UCode	Name	Dates
PHLP	FORDA	Philco Western Development Labs (WDL)	1957-1966
PHFP	FORDA	Philco-Ford WDL	1966-1975
FORDP	FORDA	Aeronutronic Ford, WDL	1975 - 1976 Dec
FORDA	FORDA	Ford Aerospace/Palo Alto	1976 Dec - 1990 Oct
LOR	FORD	Space Systems Loral	1990 Oct - 2012 Nov
SSL	FORDA	MDA-SSL	2012 Nov - 2017 Oct
SSLMAX	FORDA	Maxar SSL	2017 Oct -2019 Mar
MAXSS	FORDA	Maxar Space Solutions	2019 Mar - present

In the organization database each code is paired with a UCode, so that all the codes with a common UCode can be identified. This allows us to understand that there is a historical connection between satellites built by SSL and those whose manufacturer was PHFP.

So, all the 1300 series communications satellites were built by (Ucode) FORDA, but each one can also be tagged with the specific name of the company as it existed at the time of the satellite's launch.

Note that countries can have phases too - the Czech republic is CSSR (1940-1990), CSFR (1990-1993) and CZ (1993-present), sharing the ucode CZ. Note that for countries extant in the early 21st century, the ucode is usually the Internet TLD, e.g. CN like .cn for Zhongguo (China), although the usual single-letter abbreviations have been

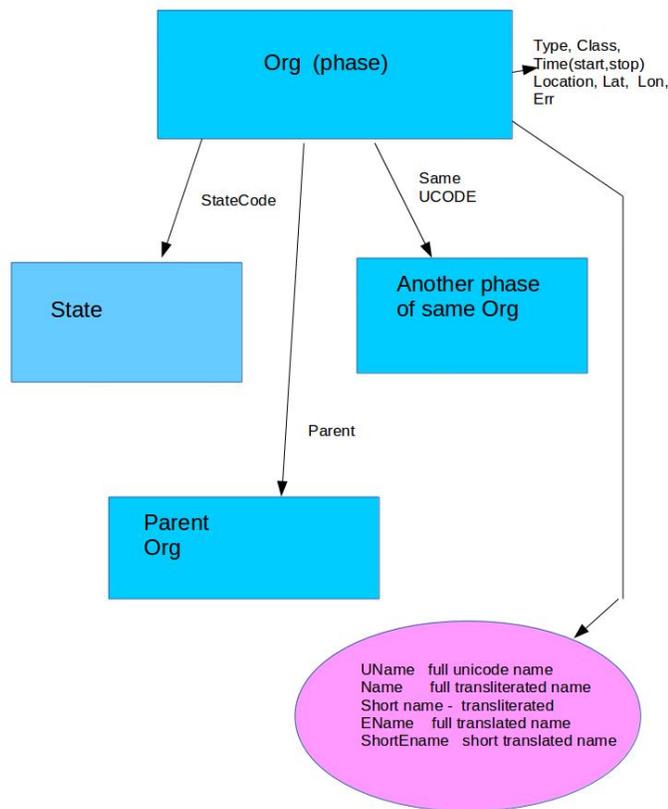

used for European Union countries e.g. D for Deutschland (Germany), F for France etc. Most two-letter ucodes are countries but there are a few exceptions (LM for Lockheed Martin, for example).

### II.1.3 The Database

The database consists of a single (See table) in which each record is an organizational phase with its Org Code. The columns are:

Column Name	Description
Code	Org Code for organization in a particular phase (time period)
UCode	'unified' Org Code for organization across all time periods
StateCode	OrgCode for organization's host state.
Type	Organization roles: a slash-separated set of types.
Class	Organization class: A, B, C, or D (Nonprofit, commercial, civil or defence)
TStart	Calendar date of phase start - e.g. when the org was founded
TStop	Calendar date of phase end - e.g. when the org was closed or renamed
ShortName	Short name of organization (ASCII, host language)
Name	Full name of organization (ASCII, host language)
Location	Approximate location (e.g. city)
Longitude	Longitude of location, deg E
Latitude	Latitude of location, deg N
Error	Error in lon/lat, deg
Parent	OrgCode of organization of which this org is a part
ShortEName	Short name of organization (ASCII, English)
EName	Full name of organization (ASCII, English)
UName	Full name of organization (Unicode, host language)

The way these columns are used is explained in more detail in the following subsection. First I present a diagram illustrating how the database entries relate the different organizations to one another:

### II.1.3.1 Column details

- **Code - the Org Code for this organization/time phase.**
- **UCode - the unified Org Code for all phases for this organization.**
- **StateCode - Org Code for the nation-state, IGO or other polity** with responsibility for the organization. This is normally the country in which the organization is located (referred to as 'host country' in the remainder of this document). Type of the state code must be CY, IGO or AP.
- **Type - the organization type**

This indicates the role of the organization, e.g. a payload operator, a launch agency, etc. The current database is somewhat patchy in data quality for this field, and I do not recommend relying on data in this column with the exception of the special values CY, IGO and AP which indicate entries with a status equivalent to a nation-state.

An entry can have multiple values of Type which are separated by a slash character, e.g. LV/E indicating the organization has both LV and E roles. Alternatively, an entry may have no Type value present at all.

Additional roles are reserved for the related Launch Sites database and are noted in the table below.

The full list of roles is:

Type code	Meaning
<b>States and similar entities</b>	
CY	Country (i.e. nation-state or autonomous region). Not always the same as the ISO3166 code even when the latter exists.
IGO	Intergovernmental organization. Treated as equivalent to a country for the purposes of tabulations of launches by country etc.
AP	Astronomical Polity: e.g. Luna, Mars. Used for the 'country' field for locations that are not on Earth and therefore don't have a country.
<b>Manufacturers</b>	
E	Engine manufacturer
LV	Launch vehicle manufacturer
W	Meteorological rocket launch agency or manufacturer
PL	Payload manufacturer
<b>Operators</b>	
LA	Launch Agency
S	Suborbital payload operator
O	Payload owner
P	Parent organization of another entry
<b>Launch origin or destination</b>	
LS	Launch site
LP	Launch position
LC	Launch cruise
LZ	Launch zone
TGT	Suborbital target area

- **Class - the organization class.**

Each organization is tagged as one of:

- A (Academic, amateur and non-profit)
- B (Business/commercial)
- C (Civil government)
- D (Defense/military/intelligence)

The same classes are used in the satellite payload database to mark individual satellites - usually the class of the satellite is the same as the class of the owner organization, but not always.

- **TStart and TStop** - start and stop time of this organization phase. Given in year, month, day format (actually Vague Date format. )

Null values are indicated by a dash. Null TStart means the start date of the organization is unknown; Null Stop means that the organization is still in operation, or assumed to be so.

- **ShortName** - a short ASCII name of the organization suitable for use in labels or tables, nominally a transliterated representation of the name in the host country's own language (or one of its principal languages, as appropriate).

- **Name** - a full name (up to 80 ASCII characters). Transliterated full name of the organization, in host country's language.

- 
- **Location** - City and locality of the organization. In many cases this is given in the form UrbanArea-Suburb, e.g. "Los Angeles-El Segundo". The precise address is not currently included in the database, although admittedly this would have been desirable.
  - **Longitude, Latitude, Error.** - The values are geographic longitude (east-positive) and latitude in decimal degrees.

For the Organizations database the error field is not filled but is usually 0.1 deg.

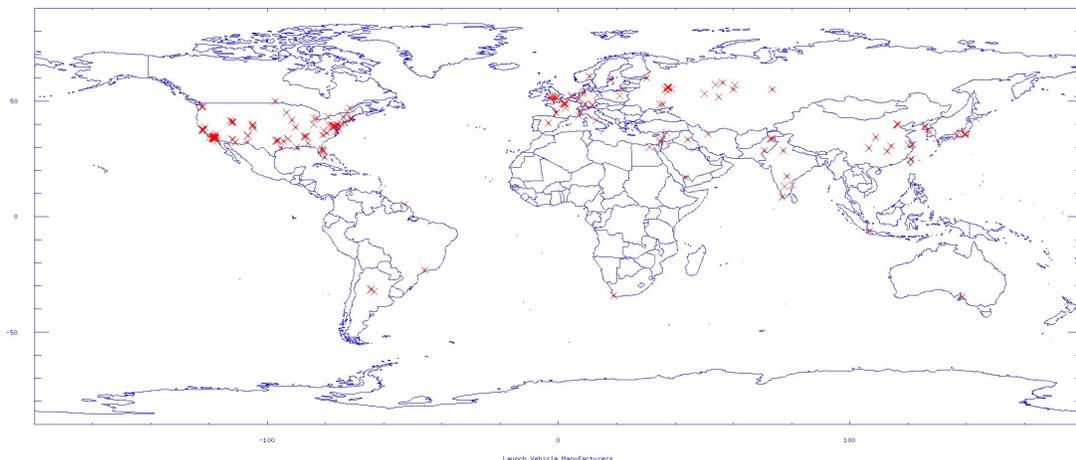

- **Parent**, when nonempty, provides an Org Code of the organization of which the current entry is a subset. Thus, NASA is the parent of Goddard Space Flight Center.

Note that in a few cases, an Org is noted as having more than one parent (two Org Codes separated by a solidus, e.g. MOTI/TMI). In these cases the Org is an equal joint venture of the two parents. However in practice in my software I ignore the second parent.

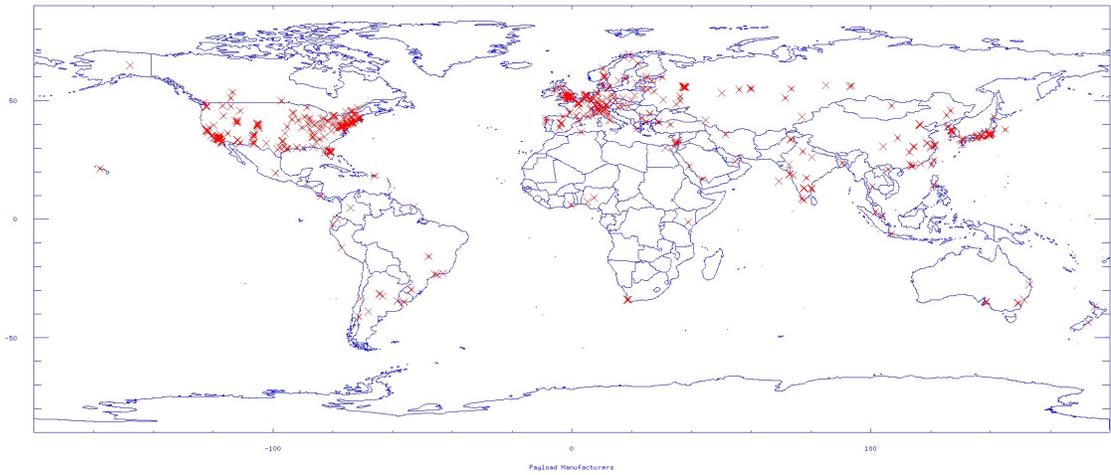

- **ShortEName** - Short name in English. Useful for summary information. Can be omitted when ShortName is itself English.
- **Ename** - Long (full) name in English.
- **UName** - Unicode version of full name in organization's parent language.

We can use the mask field to look at the geographic distribution of various types of organization:

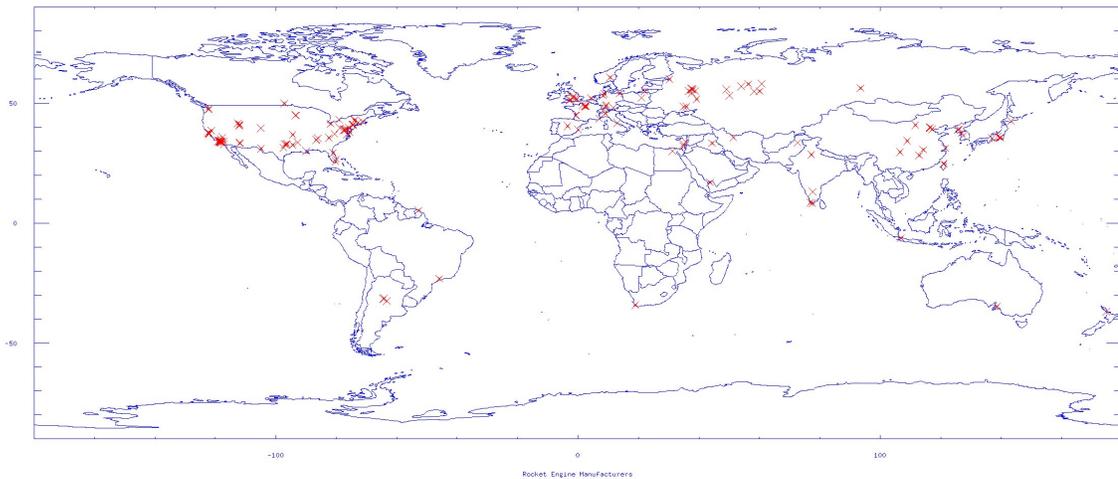

Launch vehicle and stage prime contractors:

Payload manufacturers:

Engine manufacturers:

### II.1.3.2 Sources

For contemporary satellites and rockets, organizations were largely identified from mission press kits and web sites. For historical missions, archival sources, Aviation Week, Flight International, and Jane's All the World's Aircraft (and Jane's Spaceflight Directory) were useful.

(See Note: Vague Date Format)

## **Part III**

# **Launch Sites**

# Chapter III.1

## The Space Launch Origins Catalog

### III.1.1 Introduction

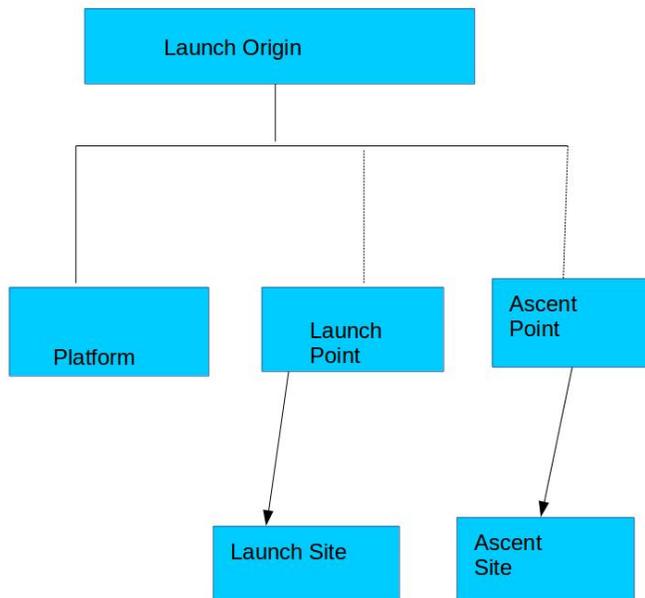

#### III.1.1.1 Launch Origin

Each rocket launch in the General Catalog has an associated **launch origin**. The ‘launch origin’ generalizes the concept of a launch site, because nothing is ever simple. It consists of:

- the **Platform** (optional): either a ship or an airplane from which the rocket is launched. (The platforms are discussed in detail in a separate section.
- the **Launch Pad** or **Launch Point** (LP for short, unifying the two terms) where the rocket ignition occurs; LPs are always associated with
- a **Launch Site** which groups together related LPs.

However, for an air launch, we consider **two** Launch Site/LP pairs: the location of the departure runway where the aircraft takes off, and the location where the rocket drops from the plane and ignites. This latter pair we call:

- the **Ascent Site** and
- the **Ascent Point**. For other launches we consider the Ascent Site and Ascent Point to be identical with the Launch Site and Launch Point. (Ideally, for sea launches one would track the ship port departure point and distinguish it from the launch itself in the same way, but usually that information is not known).

If the Platform is a ship on a research cruise and the launch point is not a regular (reused) point, the Launch Site (and the Ascent Site) is the expedition code. Ascent Points for airplanes and ships near an existing launch site and under its range authority, may be grouped together either under that launch site or a special related ocean-specific launch site. For example, we distinguish between the Cape Canaveral land-based pads at site CC and the air and sea launches off the Cape coast at site ETR (Eastern Test Range); this makes the LPs for site CC geographically compact, which can be helpful for display.

Associated with each Launch (or Ascent) Site is an implicit LP with the same name as the Site, for launches where we know the Site but not the particular pad.

The association of LPs with Sites is usually obvious for the land based pads at major launch sites. However for remaining LPs it is somewhat arbitrary and I have not been terribly consistent.

### III.1.1.2 Launch Sites database

The information needed to describe the existence, time-dependent nomenclature, and location of a launch site and its launch pads is similar to that needed for an organization. The database has two files, one for the Sites and one for the individual LPs. The format is almost the same for each file.

- **Site** contains the org code for the launch site.
- **Code LP file:** contains the org code for the LP; Sites file: is blank, since the Site is the org code.
- **UCode** Unified org code for the entry. The Code and UCode are not globally unique for launch pads, but are unique when combined with their Site values.

---

For example White Sands Army Launch Area 2 has LP entries with org code values ALA2 (1958-1960) and LC36 (1960-). Each LP entry has UCode ALA2 and Site value WS. The Site value corresponds to an LS entry which also has Site value WS, tying the launch pad to its launch site.

As another example, the LP org code value LC2 is not unique; Site code PF and Site code CC each have an LP with org code LC2. Internally in software searches are made by concatenating the Site and LP codes, e.g. "CC LC2".

In other respects the Sites and LP databases are identical in structure with the Orgs one.

The Sites records are:

- **Site** - the Org Code for this launch site (or, for this time phase of this launch site, if it has multiple phases - i.e. changed its name).
- **Code** - a blank entry (for back compatibility).
- **UCode** - the unified Org Code for all phases for this launch site.
- **Type** - the launch site type (LS, LC, LZ).

There are three types of Site:

- the **Launch Zone (LZ)**, a geographically more or less compact zone grouping air and/or sea LPs;
- the **Launch Cruise (LC)**, a temporally compact but geographically extended zone (possibly over multiple oceans) representing a research cruise expedition with multiple sea LPs;
- the **Launch Site (LS)**, for everything else, i.e. land based launch sites.

Additional reserved site types for future use are

- **LNZ** - Landing zone
- **TGT** - Target impact location, e.g. for missiles
- **StateCode - Org Code for the nation-state, IGO or other polity** with responsibility for the launch site. This is normally the country in which the site is located. Type of the state code must be CY, IGO or AP, and the code must occur in the Organizations Database.
- **TStart and TStop** - start and stop time of this launch site phase. Given in year, month, day format (actually Vague Date format. )

Null values are indicated by a dash or an asterisk. Null TStart means the start date of the organization is unknown; Null Stop means that the organization is still in operation, or assumed to be so.

- **ShortName** - a short ASCII name of the site suitable for use in labels or tables, nominally a transliterated representation of the name in the host country's own language
- **Name** - a full name (up to 80 ASCII characters). Transliterated full name of the launch site, in host country's language. Where known, this is the formal name of the launch site.
- **Location** - City and locality of the launch site. In many cases this is given in the form UrbanArea-Suburb, e.g. "Los Angeles-El Segundo".
- **Longitude, Latitude, Error.** - The values are geographic longitude (east-positive) and latitude in decimal degrees.

The error field gives the uncertainty of the launch site location. Note that when a launch site contains multiple launch pads or launch points, the position given for the site is a bit arbitrary, and you should consult the LP (launch points) database for precise positions.

- **Parent**, when nonempty, provides an Org Code of the organization operating the launch site.
- **ShortEName** - Short name in English. Useful for summary information. Can be omitted when ShortName is itself English.

- 
- **Ename** - Long (full) name in English.
  - **Group** - At present, this field is used to group together ocean launch sites, lunar sites, and some unknown V2 launch areas. The field is likely to be repurposed in future releases.
  - **UName** - Unicode version of full name in organization's parent language.

### III.1.1.3 Launch Points database

The Launch Points records are:

- **Site** - the Org UCode for the launch site of which this LP is a part. Every LP is part of a Launch Site.
- **Code** - an Org code for this LP (or for this phase of this LP, for LPs with multiple time phases).
- **UCode** - the unified Org Code for all phases for this LP.
- **Type** - the launch point type is always LP
- **StateCode** - this field is blank for LPs in the current release; the LP is considered to inherit the StateCode of its Launch Site.
- **TStart and TStop** - start and stop time of this phase. Given in year, month, day format (actually Vague Date format. )

Null values are indicated by a dash or an asterisk. Null TStart means the start date of the organization is unknown; Null Stop means that the organization is still in operation, or assumed to be so.

- **ShortName** - a short ASCII name of the site suitable for use in labels or tables. often a concatenation of the Site and LP codes.
- **Name** - a full name (up to 80 ASCII characters). Transliterated full name of the launch point, in host country's language.
- **Location** - City and locality of the launch point. In many cases this is given in the form UrbanArea-Suburb, e.g "Los Angeles-El Segundo".
- **Longitude, Latitude, Error.** - The values are geographic longitude (east-positive) and latitude in decimal degrees.

The error field gives the uncertainty of the launch point location. In contrast to the Organizations database, I have attempted to find as accurate positions as possible for the LP values.

- **Parent**, when nonempty, provides an Org Code of the organization operating the launch site.
- **ShortENAME** - Reserved for short name in English. Not used in the current release but retained for compatibility with the Orgs database format.
- **Ename** - Reserved for long name in English. Not used in the current release but retained for compatibility with the Orgs database format.
- **UName** - Unicode version of full name in organization's parent language. Not currently supplied for the LP database, but I might fill it in in a future release.

## **Part IV**

# **Launch Platforms**

# Chapter IV.1

## Platforms

### IV.1.1 Platform data structure

Some space launches are carried out from mobile structures which don't have a fixed geographical location. I thus distinguish between the 'platform' (the vehicle used as a launch platform) and the 'site' (the geographical location at which the platform was located when the rocket separated from it).

Platforms which have been used to launch rockets include surface ships, submarines and aircraft. (I also include the KSC pad 39 mobile launch platforms, just because I want to record which one was used for which launch and it's a useful database field to stash that particular information.)

I consider ship launches to fall into two main categories: individual launches from launch zones (LZ) and launches on cruises (LC). In a cruise, a specific ship launches a series of rockets at different (sometimes widely different) geographical locations (launch points). Conceptually I think of the cruise path as a launch site and the launch points as different launch pads in that site. However, some launch points were used many times by different ships and cruises. These frequently used launch locations (e.g. OJP, in the Pacific at 160E 0N) are instead defined as a launch zone. Therefore, a cruise can consist of launches associated with the cruise's own site (LC) value and also with one or more standard LZs. For example, the Akademik Korolev (KORO) made a cruise in Feb-Mar 1973 (cruise GMS73A) which had launches from launch points LP1 to LP8 associated with site value GMS73A as well as launches from frequently-visited Indian Ocean sites IO65, IOCOR, RODR, IOSWR and IO6540. I recognize that this is a bit messy but I think making explicit that these sites are used by multiple ships and cruises is helpful.

The fields in the Platforms data file are

- **Code:** an Org Code for the platform (or for this time phase of the platform; alt phases for any platform in the current list, except for the LC39 mobile launch platforms)
- **UCode:** Unified Org Code for the platform. Usually the same as the Code field.
- **StateCode:** Org code for the country owning the platform.
- **Type:** Type of platform. Types are PLAT (generic platform) SHIP, SUB, and AIR (with obvious meanings).
- **Class:** What kind of organization owns the platform (A,B,C, D as per the Orgs database. Most often D here, as most platforms until recently were owned by the military).
- **TStart and TStop** - start and stop time of this launch site phase. Given in year, month, day format (actually Vague Date format. )

Null values are indicated by a dash or an asterisk. Null TStart means the start date of the organization is unknown; Null Stop means that the organization is still in operation, or assumed to be so.

- **ShortName** - a short ASCII name of the site suitable for use in labels or tables, nominally a transliterated representation of the name in the host country's own language

- 
- **Name** - a full name (up to 80 ASCII characters). Transliterated full name of the launch site, in host country's language. Where known, this is the formal name of the launch site.
  - **Location** - City and locality of the launch site. In many cases this is given in the form UrbanArea-Suburb, e.g. "Los Angeles-El Segundo".
  - **Longitude, Latitude, Error.** - The values are geographic longitude (east-positive) and latitude in decimal degrees.

The error field gives the uncertainty of the launch site location. Note that when a launch site contains multiple launch pads or launch points, the position given for the site is a bit arbitrary, and you should consult the LP (launch points) database for precise positions.

- **Parent**, when nonempty, provides an Org Code of the organization operating the launch site.
- **ShortENAME** - Short name in English. Useful for summary information. Can be omitted when ShortName is itself English.
- **ENAME** - Long (full) name in English.
- **VClass** - vehicle class, used mainly to describe ship class.
- **VClassID** - identification serial within vehicle class
- **VID** - another field for identification serial for the platform, e.g. IMO number for ships, where applicable.
- **Group** Used to group together platforms in the later subsections of this document.
- **UNAME** - Unicode version of full name in organization's parent language.

## IV.1.2 Catalog of platforms

### IV.1.3.1 Passat

Пассат

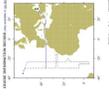

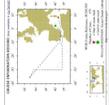

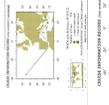

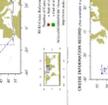

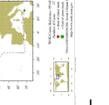

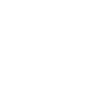

Credit: Photo from wrk.ru forums, file "Passat (V88) 2016-11-23.pdf".

The Passat launches are unusual in that they were almost all from the same location, 53N 35W, where Passat remained during its research.

Note: Cruise data for SU012423 puts Passat at the usual 53N 35W location on 1989 Jan 31. I therefore assume that PASS89A was also at that location for 1989 Feb 1-22. Similarly, SU012425 puts Passat at that location on 1989 Apr 25, 1 week before the start of PASS89B. PASS90B starts a few days after SU111251 but that cruise was more dynamic in location so it's less clear what one can infer.

Rockets used: MMR-06

### IV.1.3.2 Musson

Муsson

Credit: Photo from wrk.ru forums, file "Passat (V88) 2016-11-23.pdf".

Credit: -

Note: The cruise maps from NOAA often cover longer periods than the active period of rocket launching - e.g. the Jan 1982 expedition is part of a cruise from Nov 1981 to Apr 1982 which goes back and forward across the ocean, but during the 29 day period of MMR-06 launches the ship was roughly stationary at the MINIA location.

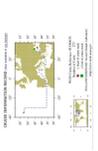

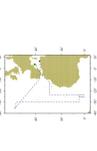

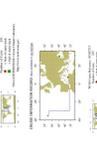

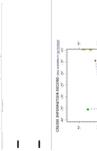

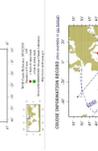

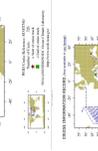

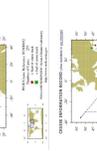

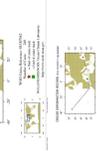

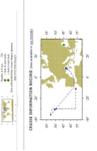

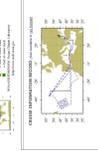

Note: The WDC-A/RS database gives positions for Musson's Expedition 5 at 53N 35E, in the middle of the Russian countryside - unlikely for a ship. I assume this is a mistake for its usual position at 53N 35W.

Location of Musson on both 1989 May 31 (end of cruise SU012426) and 1989 Jul 1 (beginning of SU012114) was at the MINIA location, so for Expedition 13 during the intervening month I assume it remained there.

### IV.1.3.3 Volna

Волна

#### «Волна»

с 1995 – «Бриз»

1968–2006

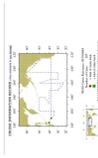

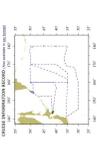

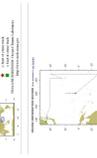

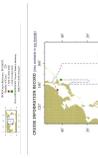

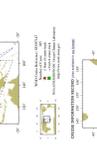

Credit: Photo from wrk.ru forums, file "Passat (V88) 2016-11-23.pdf".

Volna was renamed Briz in 1995.

Rockets used: MMR-06

Updated: 2024 Nov 28 03:19:31

Cruises: VOLNA

LC_Code	Active	Region	Cruise	CruiseMap
GMS76B	1976 Feb 1 - 1976 Mar 31	Pacific Ocean	Volna Expedition 1, 1976 (SU016684)

### IV.1.3.6 Georgiy Ushakov

Георгий Ушаков

Credit: Photo from wrk.ru forums, file "Passat (V88) 2016-11-23.pdf".

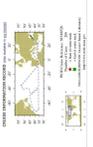

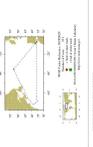

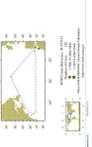

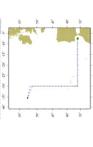

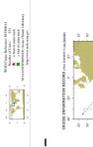

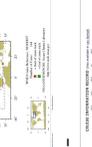

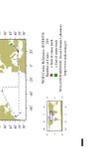

Originally Shkval ('squall'); renamed 1984 Nov. Owned by GOI/GMS Odessa.

Note: There is little evidence for the location of the 1989-1990 launches, but the ship is known to have been in the same general area of the Atlantic as MINIA and so it seems likely that the launches were from there.

Rockets used: MMR-06

### IV.1.3.7 Ernst Krenkel'

Эрнст Кренкель

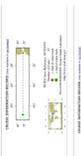

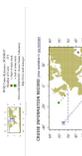

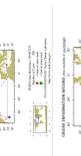

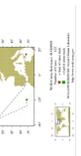

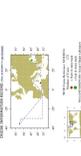

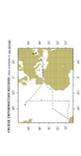

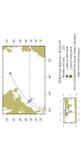

Credit: -

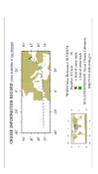

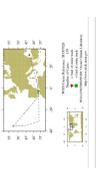

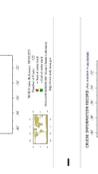

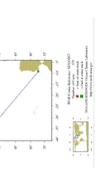

Credit: -

Originally named Vikhr' ('vortex'). Renamed Ernst Krenkel' in 1972.

Rockets used: MMR-06

Updated: 2024 Nov 28 03:19:31

#### IV.1.3.8 Yu. M. Shokal'skiy

Ю. М. Шокальский

Credit: -

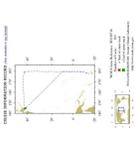

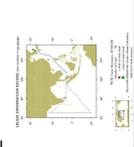

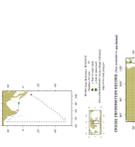

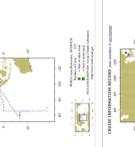

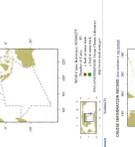

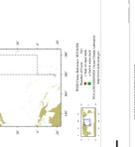

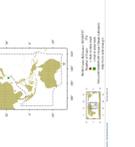

The association of the 1966 Dec expedition with the Shokalskiy is speculative.

The WDC Rocket File gives spurious positions for the summer 1979 expedition. I assume a zero has been dropped from the longitudes so that the ship was in mid-Pacific rather than the middle of Eastern Europe.

Rockets used: M-100

#### IV.1.3.9 A. I. Voeykov

А.И. Воейков

Credit: -

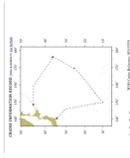

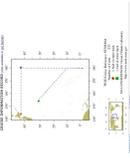

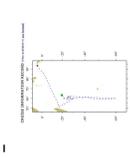

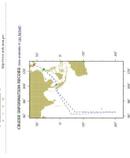

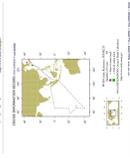

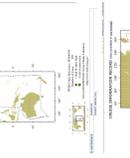

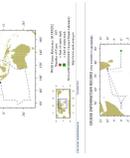

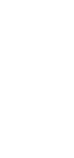

Note: In NSSDC/WDC-A/RS document 78-02, "Launch Summary 1973-77", and other derived NSSDC rocket databases, some M-100 launches in 1973 are associated with a ship called 'NOYEKOV'. It is now clear that this was a typo and these launches were from the Voeykov.

Note: the online version of the NSSDC rocket file available from GSFC in the 1990s alas did not retain ship-launch positions. I also understand the original records were discarded by WDC/A-RS, alas. The 1986 cruise has no corresponding entry in the NOAA OCL WOD lists, so we don't even know which ocean the launches were from.

Note: the association of the 1966 Dec expedition with the Voeykov is speculative.

Rockets used: M-100,M-100B

### IV.1.3.10 Akademik Shirshov

Академик Ширшов

Credit: -

Also referred to as Akademik Pyotr Shirshov.

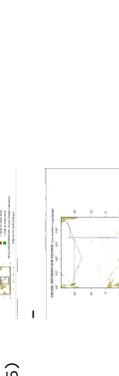

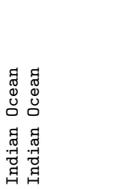

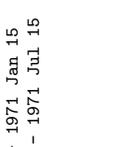

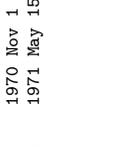

Note: launches in Jul-Sep 1973 attributed in the WDC Rocket File to the Shirshov, and originally labelled Shirshov Exp. 4 by me, appear to actually be from the Korolev - several sources confirm the CIMO 1973 launches at Kourou were from the Korolev.

Rockets used: M-100,M-100B

### IV.1.3.11 Professor Vize

Профессор Визе

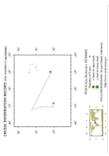

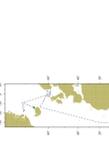

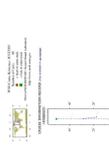

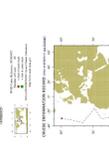

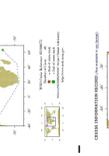

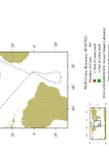

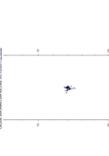

R/V Professor Vize, built in 1968 (AARI)

Credit: Unknown

GMS SSSR research ship operated by Arctic and Antarctic Research Inst., Leningrad. Built 1966. IMO 6707674. Mass: 5714 tons

Rockets used: MR-12,MR-20

Updated: 2024 Nov 28 03:19:31

### IV.1.3.12 Professor Zubov

Профессор Зубов

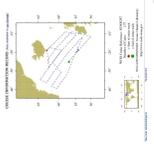

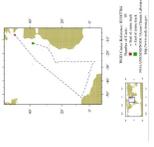

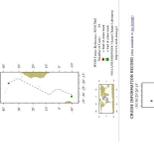

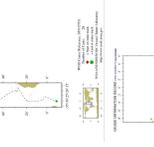

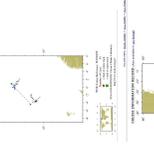

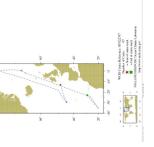

Credit: Unknown

GMS SSSR research ship operated by Arctic and Antarctic Research Inst., Leningrad. In service 1967. Mass: 6900 tons. Code: 6602

Notes: the vessel for the 1969 Jul launches was not given in the WDC Rocket File, but the Shidrovskiy 2003 book (MRKS) reveals that these were the first weather rocket launches from the Zubov.

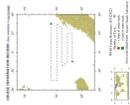

Rockets used: MR-12,MR-20

Updated: 2024 Nov 28 03:19:31

### IV.1.3.13 Akademik Korolev

Академик Королёв

Credit: Unknown

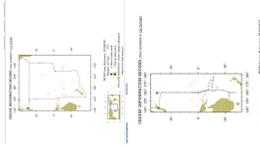

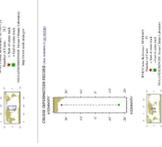

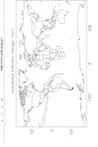

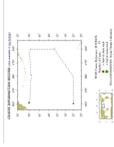

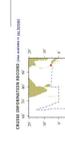

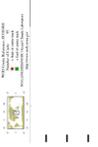

There were two Soviet research ships associated with Korolev: the Akademik Korolev (this one) and the Akademik Sergey Korolev (a larger space tracking ship). Thanks to Brian Harvey for drawing this to my attention.

Some launches are not associated with particular vessels in the WDC Rocket File but do have latitude and longitude. The NOAA NODC (National Oceanographic Data Center) database ([nodc.noaa.gov](http://nodc.noaa.gov)) gives cruise data for particular vessels, with latitude and longitude versus time. was useful in identifying some of these.

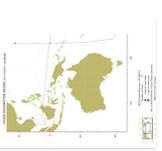

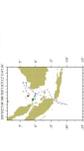

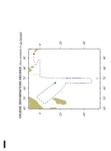

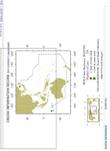

Rockets used: M-100,M-100B,Super Loki

Updated: 2024 Nov 28 03:19:31

Cruises: KORO

#### IV.1.4.1 USS Atka

Credit: US Navy

The USCGC Southwind (WAG-280) was built in 1943 and transferred to the USSR in 1945-1949 as the Admiral Makarov, then transferred to USN as AGB-3 USS Atka. In 1966 she went back to USCG as the WAGB-280 USCGC Southwind. It was retired in 1974.

Rockets used: Deacon Rockoon

#### IV.1.4.3 USS Staten Island

Credit: US Navy

Built 1942 as USCGC Staten Island (WAGB-278), transferred to USSR as Sverny Veter, then returned to USN in 1951 at USS Northwind (AGB-5), renamed USS Staten Island 15 Apr 1952, transferred to USCG in 1965, retired 1974.

The USS Staten Island was based at Boston Naval Shipyard from 1952 to May 1955, and at Seattle from 1955 to 1973.

The 1953 expedition was part of Project Muskrat. The Staten Island left Boston on 1953 Jul 18 (Ludwig 2011).

#### IV.1.4.4 USS Eastwind

Credit: US Navy

Ludwig (2011) reports that the Eastwind departed Thule, Greenland on 1952 Jul 29, the SUI team having flown to Thule to join it there. After a voyage to Alert Base (62.3E 82.5N) the Eastwind proceeded to Murchison Sound for the launches, and returned to Thule on 1952 Sep 5.

#### IV.1.4.11 USNS Croatan, Wallops Mobile Range Facility

Credit: NASA

Built 1942 as USS Croatan; Became non-commissioned USNS Croatan in 1958. Assigned to NASA Oct 1964-May 1965. Scrapped 1971.

Rockets used: Nike Apache,Nike Cajun,Arcas,Loki Dart

Updated: 2024 Nov 28 03:19:32

Cruises: CVE-25

#### IV.1.4.12 USNS Range Recoverer

Credit: US Navy

Built 1944 as FS-278, converted to MSTST T-AG-161 in 1960, and then to T-AGM-2/USNS Range Recoverer in Nov 1960.

Note: A Feb 1966 mid-Atlantic Arcas launch was reported by the IRIG Meteorological Working Group (Document 109-62, Vol LIV, Feb 1966 Firings) as being from 'Ship Sierra'. This might be the USS Sierra, but there's no other indication it was ever involved in weather rocket firings. It seems more likely that 'Sierra' is just a code letter S in the phonetic alphabet (perhaps as Quebec and Victor were associated with the range ships Coastal Sentry and Rose Knot). I further speculate that the firing was a proof of concept precursor to the Zorba eclipse firings, and that Ship Sierra was in fact the Range Recoverer; obviously this is a rather tenuous guess.

Rockets used: Boosted Arcas

#### IV.1.4.14 USAS American Mariner

Credit: US Navy

Credit: US Navy

The TS American Mariner operated as a USCG training ship from 1941 to 1953. In 1953 it was transferred to the US Army and became the USAS American Mariner; it supported the US Army/ARPA DAMP reentry tracking project in 1959-63, during which it launched at least one Arcas rocket off the coast of Cape Canaveral. In 1963-4 it was transferred briefly to the USAF and then in Jan 1964 to the US Navy as USNS American Mariner. The ship was retired in 1966.

#### IV.1.5.6 USNS Observation Island

Credit: US Navy

The Empire State Mariner was built in 1953 for United States Lines and the US Maritime Commission. It was transferred to the USN in 1956 and redesignated EAG-154 (Experimental Miscellaneous Auxiliary) Observation Island. It was redesignated AG-154 in Apr 1968, placed in reserve 1972-79 and then used by Military Sealift Command as the missile range instrumentation ship USNS Observation Island, designated T-AGM-23. It was retired in 2014.

### IV.1.6.1 USS Richmond K. Turner

Credit: US Navy photo

The Richmond K. Turner was used in 1992-95 to launch the Terrier/LEAP tests, which were precursors to the SM-3 AEGIS.

Rockets used: Terrier LEAP

Updated: 2024 Nov 28 03:19:32

Launches: CG-20

Date	Rocket	Flight	Mission	Platform	Site	LP	AscSite	AscLP	Pos	Apogee
1992 Sep 24	Terrier LEAP	FTV-1 (Dummy LEAP)	-	CG-20	PM	-	-	-	119.1W 34.1N (+/- 0.0)	30.0
1995 Mar 4 1020	Terrier LEAP	FTV-3	-	CG-20	AONC	-	-	-	73.7W 33.8N (+/- 0.0)	30.0
1995 Mar 28	Terrier LEAP	FTV-4	-	CG-20	AONC	-	-	-	73.7W 33.8N (+/- 0.0)	30.0

---

### IV.1.6.2 USS Jouett

Credit: US Navy photo

The Jouett was used in 1992 to launch a Terrier/LEAP test. Designation DLG-29 from 1964 to 1975; then CG-29.

Rockets used: Terrier LEAP

Updated: 2024 Nov 28 03:19:32

**Launches: CG-29**

Date	Rocket	Flight	Mission	Platform	Site	LP	AscSite	AscLP	Pos	Apogee
1993 Sep 27	Terrier LEAP	FTV-2 LEAP Mockup	-	CG-29	USS Jouett PM	-	-	-	119.1W 34.1N (+/- 0.0)	30.0

---

### IV.1.6.3 USS Shiloh

Credit: US Navy photo

The Shiloh was used to launch Aegis SM-3 missiles.

Rockets used: SM-3

Updated: 2024 Nov 28 03:19:32

Launches: CG-67

Date	Rocket	Flight	Mission	Platform	Site	LP	AscSite	AscLP	Pos	Apogee	
1999 Sep 24	SM-3	Stellar Phoenix	-	CG-67	USC Shiloh	KAU	POA	-	159.8W 22.1N	(+/- 0.0)	107.0
2006 Jun 22 2204?	SM-3	Stellar Predator	-	CG-67	USC Shiloh	KAU	POA	-	159.8W 22.1N	(+/- 0.0)	150.0

#### IV.1.8.6 Unknown Israeli ship

**NO IMAGE  
AVAILABLE**

From 1990 to 1999 Arrow 1 interceptors were test-launched from a ship (or ships) in the Mediterranean against targets launched from Palmachim. The Sa'ar 4.5 class boat INS Hetz, or similar, seems to me to be a plausible candidate.

Rockets used: Arrow 1

## IV.1.14 Soviet Missile Submarines - Project 667/667A

Credit: Apa'lkov et al 2006

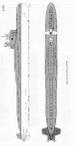

Credit: Apa'lkov et al 2006

The Project 667A Navaga submarines (NATO codename YANKEE) carried 16 R-27 missiles. The K-140 was later converted to Project 667AM Navaga-M, with the R-31 missile.

Some 667 submarines were converted to 667AT and 667M variants without ballistic missiles.

## IV.1.19 Soviet Missile Submarines - Project 941

Credit: (c) A.D. Baker, III; from Polmar and Moore, Cold War Submarines

Credit: Apa'lkov et al 2006

The Акула (Akula, shark) class Project 941 submarine had the NATO reporting name Typhoon. Each Akula submarine carried 20 R-39 Rif missiles (D-19 launch system). TK-208 was later converted to test launch the Bulava missile.

### **IV.1.29.2 B-29 or B-50 Superfortress, unknown S/N**

The X-7A-1 missile was launched from two airplanes: the B-29B-60-BO S/N 44-84073 (my code B-29-073) and the B-29-55-BO S/N 44-86402 (my code B-29-402). We don't know which missile was dropped by which plane, so the generic B-29 code is used for each of the launches.

#### IV.1.29.6 JTB-50D-80-BO Superfortress S/N 48-0068

Credit: Unk

Credit: Unk

The B-50 Superfortress was an improved derivative of the B-29. B-50D no. 58-0068 was used at White Sands for X-7A3 launches. The picture shows a different B-50D; let me know if you have one of 58-0068. A different B-50 was used at Edwards for X-1 launches. (6004?)

Rockets used: X-7A-3,X-7B

Updated: 2024 Nov 28 03:19:34

## IV.1.29.7 B-52G/H Stratofortress

Credit: Unk

This code covers various B-52G and B-52H aircraft used for SRAM test launches. The aircraft took off from a variety of bases and launched their missiles over the Atlantic off Cape Canaveral.

The SRAM missiles were low altitude rockets and are included here mainly to complete the Cape Canaveral launch list.

SRAM missiles were also launched by the FB-111 and later by the B-1B.

B-52G 57-6518 was used for the 1971 Jul 22 flight at White Sands.

#### IV.1.29.9 B-52G Stratofortress S/N 57-6473

Credit: Unk

Credit: Unk

Steve Pace, in his book X-Planes over Edwards, reports that B-52G 57-6473 was used for Skybolt captive trials at Edwards because the B-52H was not mature enough. Other reports suggest there was a single B-52G used for trials, although B-52H planes were photographed carrying dummy Skybolts. Records confirm at least 3 of the 5 launches were by a B-52G, but do not give a serial number. I will assume that 473 was used for all the actual Skybolt launches in Florida, staged from Eglin. One photo of the first launch shows a blurry tail number that appears consistent with '6473'.

Two RAF Vulcans were also used for captive trials but never made a live launch

Several B-57B aircraft attached to Kirtland AFB are thought to have carried out Cleansweep IIIB operations: Nos. 52-1502, 52-1503, 52-1504 and 52-1506. In the absence of information about specific flights this code is used to cover all of them.

Rockets used: Cleansweep IIIB

**IV.1.29.23 WB-57C Canberra S/N 53-3832 and 53-3944**

Two WB-57C Canberra planes were used for sampling missions; S/N 53-3832 and 53-3944. This code covers both of them.

Rockets used: Cleansweep III,Cleansweep IIIB

### IV.1.30.2 C-17 Globemaster III (AMC)

Image shown is a C-17 from the 535th Airlift Sqn, not necessarily one of the ones used for air-launch. The C-17 used for airdrops west of Kauai were probably based at Hickam as part of USAF 535th Airlift Sqn.. but environmental assessment reports indicate the air launch flights take off from PMRF (Kauai).

#### IV.1.30.4 C-130 Hercules

A C-130 transport was used to deploy an SR-19 missile in the AltAir (HAVE GOLD) demo of 1997. It is not clear whether or not another C-130 launch of an SR-19 based target in 1999 used the same aircraft. The 1999 launch used a C-130H. The 1997 launch used 'a Navy-supplied C-130'.

### **IV.1.31.1 F2H-2 Banshee**

The serial number for the F2H-2 used for the Navy Rockair launches is unknown. However I suspect it may well be the same aircraft, 942, that was used for the later Recruit-T55 heat transfer launches.

Rockets used: Rockair

## IV.1.31.2 F2H-2 Banshee S/N 124942

The Banshee used for Recruit Heat Transfer missions, aircraft 942, launched its payloads off the coast near Wallops. I've assumed it took off from USN Chincoteague (later NASA Wallops Main Base) but it may have been staged from Patuxent River. 942 was a NACA plane rather than a Navy one though, although according to Joe Baugher's site it was assigned to LeRC.

A Banshee was also used for the Navy Rockair launches in 1955. I suspect it was the same aircraft but don't have any evidence to support that guess.

Rockets used: Recruit, Recruit T55

### **IV.1.31.3 F-3B Demon**

The Naval Missile Center used F-3B Demon, F-4D Skyray and F-4B Phantom aircraft to launch the Sparoair I, II and III sounding rockets for various projects. The Sparoair launch list is highly incomplete and it is not always clear which aircraft was used for which launch.

Rockets used: Sparoair I,Sparoair II

#### IV.1.31.6 F-4C Phantom S/N 63-7654

Phantom II F-4C 63-7654 was used by the USAF AFSWC (Air Force Special Weapons Center) to launch the ALARR sampler rocket from White Sands in 1966. For ALARR flights in Mar 1967 onwards an F-4D replaced it. Up to that time all flights were from White Sands, but according to Aviation Week (27 Feb 1967 p 40) flights were planned from Howard AFB (Panama Canal Zone), and from Alaska. It is unclear if any such flights were in fact made.

**IV.1.31.7 F4D-1 Skyray S/N 130745**

F-4D-1 Skyray No. 130745 was to be used for CALEB test flights in 1960; it was wrecked in a fatal accident on Oct 21 but seems to have been used for the Oct 24 flight nevertheless.

---

IV.1.31.8 F4D-1 Skyray S/N 130747

F-4D-1 Skyray No. 130745 was to be used for CALEB test flights in 1960; it was wrecked in a fatal accident on Oct 21 but seems to have been used for the Jul 28 flight.

#### IV.1.31.18 F-89J Scorpion No. 53-2547

F-89J No. 53-2547 took off from Indian Springs AFB on 1957 Jul 19 at 1305 UTC and flew to the Nevada Test Site. It fired a Genie MB-1 missile with a live 1.5 kT W-25 nuclear warhead which at 1400 UTC (0700 PDT) detonated 4.2 km downrange, 6 km above the test site. The plane landed at Indian Springs at 1407. This was Operation PLUMBOB shot JOHN.

Indian Springs (now Creech AFB) has two runways, 13/31 and the large 08/26. My guess is that the larger runway is relatively new and the 1957 flight would have used 13/31.

## **Part V**

# **Launch Vehicles**

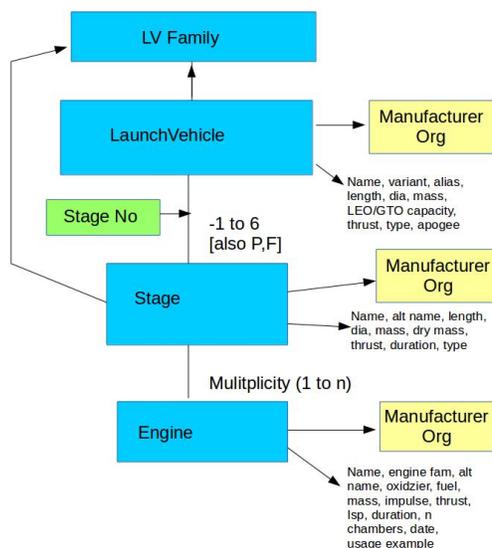

## Chapter V.1

# Launch Vehicle Descriptions

### V.1.1 Introduction

Each launch in the launch database is associated with a particular launch vehicle variant. In this section we describe these vehicles, giving approximate dimensions, masses and performance parameters. The reader should note that these approximate values are intended to give a general idea of the differences between variants - but the data is not necessarily the most accurate available and parameters given in other sources may be more reliable.

Schema for launch vehicle database, centered on the LaunchVehicle class. Each LaunchVehicle and Stage belongs to an LV Family. Each Launch Vehicle has a numbered set of stages. Each stage has a main engine type and has some (unordered) number of that type of engine. Auxiliary engines are not considered. Manufacturers of LVs, Stages and Engines are identified using an Org code linking them to the Orgs database.

Each launch vehicle variant is defined as consisting of a series of stages, and each stage is associated with a main engine type. Furthermore, each variant is a member of a larger grouping called a launch vehicle family. This structure is related in the five files that make up the launch vehicle description database:

- 
- Families - the Family file lists the different launch vehicle families.
  - LV - the LV file lists each launch vehicle variant and its overall properties, including specifying which family it is a member of.
  - LV Stages the LVtages file ties the LV and Stages file together by listing the stages in each vehicle variant.
  - Stages - the Stages file lists each different type of stage and their parameters, including the type and numbers of main engines.
  - Engines - Main engines used in each stage. The Engines file lists engines used either as Stage main engines or as satellite apogee engines.

## V.1.2 Launch Vehicle Families

In this work I have grouped stages into 'families' of related designs, and launch vehicles into families based on their first stage type. For instance, I consider the Thor Agena, Thor Able, and Delta II to be members of the same family, while Atlas Agena, Atlas Able, and Atlas Centaur are a second family. Ariane 1 to 4 and Ariane 5 are separate families - Ariane 1 to 4 share a common first stage design, but Ariane 5 is an entirely different rocket.

It's easier to maintain listings on a per-family basis, and the total number of first stage families is about 330 - much smaller than the 1500 or so different launch vehicle variants. There are some grey areas in assigning vehicles to families, but it's much less problematic than splitting hairs about slight differences between variants.

The rule I've adopted for defining a new family is a change in the tankage diameter. In some ways this is a superficial thing - to a rocket engineer, changes in the engine and the avionics will be much more significant than a change in the external dimensions - but in practise the diameter criterion works well and reveals important design commonalities between different launch vehicles. There are some marginal cases - the Trident II and Trident I missiles are closely related but have different diameters. The real complication comes in deciding which stage is the first stage. For orbital vehicles it's pretty clear, on a Delta II the Thor-derived first stage is a true first stage, it wouldn't make sense to count the GEM strap-ons as the core of the vehicle. But for many sounding rockets the vehicle consists of a booster and sustainer, with the booster falling off after only a couple of seconds. Is a Nike-Aerobee (Aerobee 170) a Nike variant or an Aerobee variant? After much agonizing I have decided to consider it a Nike variant. Similarly, Skylarks boosted by Cuckoo or Goldfinch motors are under the Cuckoo family, while single-stage unboosted Skylarks are in the Raven family.

## V.1.3 Launch Vehicle List

The LV (launch vehicle) list has the following fields:

- **Name of launch vehicle**
- **Launch vehicle family** - base stage.
- **Manufacturer.** See the Orgs file.
- **Launch vehicle variant.** Sometimes two different launch vehicles have the same name. For instance, the Vanguard rocket had variants with different third stages; the Little Joe 1 had various combinations of rocket motors; some variants of the H-1 had different strap-ons or different numbers of stages. These variants are indicated by an extra string in this field.
- **Alias.** An entry in this field indicates that the vehicle mentioned as an alias is an alternate name for this vehicle. For instance, the Taurus 1110 has the alias 'ARPA Taurus', indicating that the separate entry for ARPA Taurus actually refers to the same vehicle as the Taurus 1110; the vehicle was simply renamed. I have chosen in my launch listings to use the vehicle name in use by the launch agency at the time of launch. The Saturn IB, for example, was known for a while as the Uprated Saturn I, and has identical entries under each name.

- **Stage numbers.** Two numbers giving the minimum and maximum stage number. The minimum is usually 1, but sometimes 0 to allow for strapon stages, and occasionally -1 to allow for two kinds of strapon stage (e.g. Atlas IIAS).
- **Length** (metres.) The length is approximate, and may vary when different payloads and fairings are used.
- **Diameter** (metres)
- **Launch mass**, (tonnes)
- **LEO payload capacity** in kg, approximate; only provided for some of the orbital vehicles. Values in these fields are especially tentative.
- **GTO payload capacity** in kg, approximate; only provided for some of the orbital vehicles. Values in these fields are especially tentative.
- **Launch thrust**, kN.
- **Vehicle type**, see below.
- **Estimated max apogee** (kilometers). In many cases this is a rough order of magnitude (ROM) estimate. In some cases for IRBM/ICBMs I include an extra figure representing the range.

The following vehicle types are defined: (number of examples is from the 2003 release and has not been updated)

Code	Type
D	Deep Space launch
M	Missile
O	Orbital vehicle
R	Research rocket
V	Reentry test vehicle
X	Exoatmospheric test
Y	Exoatmospheric weather rocket
A	Endoatmospheric missile
C	Cruise missile
Q	Endoatmospheric reentry test
T	Endoatmospheric test/research
W	Endoatmospheric weather rocket

These types for individual launch vehicle types are slightly more finely divided than those used for the Family/Stage datafile: apart from the use of O rather than L, the R category is broken up to include V, X and Y subtypes and the T/A category is joined by the Q type. Note that the A,C,Q,T,W types of rocket never enter space (by my 80 km definition).

## V.1.4 LV Stages

The LV Stages list is quite simple. Each line represents a single stage within a vehicle. Stages are usually numbered starting from 1; 0 is used for strapon boosters, and in the rare cases where two different kinds of strapon booster are present, -1 is used as well. In some cases the nose fairing is included, and given a stage 'number' of F.

- **The vehicle name.**
- **The vehicle variant** (usually blank). Sometimes a launch vehicle manufacturer will use exactly the same designation for two versions of a vehicle with different stages or engines. I use an arbitrary string code to distinguish the versions.
- **the stage number** (which can be -1 or 0 for strapons, and F for fairing),
- **the stage name** (which maps to the Stages file)

- 
- **uncertainty flag**, a flag to indicate that it is not confirmed that this stage is the correct one.
  - **dummy flag**, a flag to indicate a dummy stage (e.g. the Cora vehicle always carries a dummy Astris stage), and finally
  - **the stage multiplicity**: e.g. stage 0 of the ASLV consists of two AS-0 strapon stages, and so has multiplicity 2.

## V.1.5 Stages

The Stages file gives basic information for all of the stages making up the launch vehicles in the LV file. The reader is again cautioned about the approximate nature of the numerical values in this file.

The file contains for each stage:

- **Stage name**
- **Stage family**
- **Manufacturer**
- **Alternate name**
- **Length (m)**
- **Diameter (m)**
- **Full mass (tonne)**
- **Dry mass (kg)**
- **Typical thrust (kN)**
- **Typical burn duration (s)**
- **Main engine name**
- **Main engine multiplicity** (i.e. the stage has this many main engines, all of the type defined in the previous column.)
- **Stage type** This doesn't really mean anything and can be ignored.

The main engine name has been made up (e.g. RD R-29 (1) for the first stage of the R-29) for cases where no name for the engine is available.

## V.1.6 Engines

The Engines file gives basic information for solid motors and liquid engines used as the main engines of stages in the Stages file. The reader is again cautioned about the approximate nature of the numerical values in this file.

The file contains for each engine:

- **Engine name**
- **Manufacturer**
- **Engine Family** (loosely defined grouping)
- **Alternative name**

- 
- **Oxidizer type**
  - **Fuel type**
  - **Mass, kg, loaded** (solids only)
  - **Total impulse**, kNs (mostly for solids)
  - **Typical thrust** (kN)
  - **Typical Isp** (s), (vacuum Isp where available)
  - **Typical burn duration** (s)
  - **Number of engine chambers** per engine
  - **Date of first flight**
  - **Example of usage**  
(stage number in brackets)

The main engine name has been made up (e.g. RD R-29 (1) for the first Stage of the R-29) for cases where no real name for the engine is available.

**Part VI**

**Launch Lists**

# Chapter VI.1

## Launch Lists

### VI.1.1 Introduction

The JSR Launch Vehicle Database is an attempt to provide a complete listing of all types of space launch vehicle, both suborbital and orbital, and indicate relationships between them. An attempt has been made to estimate numerical parameters even when they are not available in the literature, on the grounds that some reasonable estimate is better than none and gives a general idea of the vehicle's size and power.

The database gives launch times in UTC to the nearest second where available. It is the only online source for most of these launch times. An accurate launch time is important if you want to compare trajectories of different launches (did that missile launch pass close to this satellite?).

In the database:

- - all successful orbital launches are included
- - all confirmed failed orbital launch attempts are included; it is believed there are no more than a handful of unknown ones.
- - I have attempted to include all publicly documented suborbital exoatmospheric (apogee above 80 km) launches. The completeness with respect to such launches is moderately high (I would guess 70 to 80 percent) for large rockets (large sounding rockets, IRBMs and ICBMs). It is much lower (perhaps 30 to 50 percent) for small meteorological rockets where public records are comparatively lacking.
- - I have made a less comprehensive effort to document mesospheric launches, but completeness is fairly high for larger rockets and missiles with apogee in the mesosphere.
- - Endoatmospheric launches (launches with apogees below 50 km) are included on a patchy and somewhat arbitrary basis. I have attempted to include rockets that are in some way related to orbital missions, rockets that are launched from orbital launch sites (so that the launch list for that site is complete), and some rockets that I happen to find interesting. However, there is no attempt at completeness for endoatmospheric launches.

The primary access to the database is through launch lists for each 'family' of rocket. A family groups together launch vehicles with the same basic first stage design.

For each launch a citation (LTCite) is given for the existence of the launch and the source of the launch time. Occasional secondary citations are given for interest; I have not provided a detailed citation trail for the values in other columns of the tables. You have been warned. The cryptic citations are somewhat expanded in the Launch Time References file.

I acknowledge the help of Joe King and Pat Ross at NSSDC, who provided access to the old World Data Center/Rockets and Satellites launch database, and Joel Powell, Jean-Jacques Serra, Vladimir Agapov, Phillip Clark, Asif Siddiqi, Peter Hunter, Jacques Tiziou and the late Geoff Perry for sharing data over the many years it took to assemble this information. Mark Cleary at Patrick AFB, Roger Launius at NASA HQ, Elaine Liston at the KSC

---

archives, and Jeff Geiger at Vandenberg were among those who provided useful data. Mark Wade has also caught a number of inconsistencies in the designation system, which I've fixed, and Doug Burke found numerous formatting errors. Above all, kudos to Carl Rigg who once again spent several months painstakingly comparing my data with his own extensive and independently constructed lists, and caught a large number of typos and errors. Thanks to Carl, I believe that this database is now as reliable a source for launch times, launch sites and vehicle types as any currently in existence. I also thank Ulrich Brocks who has scoured on-line newspapers and other resources to track down additional launch times and details.

## VI.1.2 Launch List Column Explanations

The lists have the following fields:

- **Launch\_Tag:** an identifier for the launch. For orbital launches, this is the international (COSPAR) designation of the launch. For other launches, the designation is assigned by me using a pseudo-COSPAR format of the form yyyy-Xnnn, where yyyy is the year of launch, X is a letter, and nnn is an integer. The designations are explained in the introduction. See the detailed description in the (See Launch Designations) section of the introduction.
- **Launch\_JD:** the Julian Date (UTC) of launch, useful for sorting.
- **Launch\_Date,** the UTC Gregorian calendar date of launch (defined as first motion, so may differ by a few seconds from some sources which use rocket ignition). The date is given in (See VagueDate) format.
- **LV\_Type,** name of the type of rocket used, as given in the (See LV table.)
- **LV\_Variant** - see discussion in the description of the (See LV table.)
- **Flight\_ID:** an identifier for the particular launch, for example the serial number of the launch vehicle or the mission number or name assigned by the launch agency.
- **Flight, Mission, and FlightCode:** - additional identifiers for the launch. For orbital flights, at least one of these is usually the name of the payload. Some launches have a lot of different designations. I haven't been fully consistent about which name goes in which of the Flight, Mission, FlightCode fields, although usually names in a specific series are in the same column.
- **Platform, Launch\_Site and Launch\_Pad:** where the rocket was launched from. Usually Platform is blank and the launch site (see the Sites file) tells you where the rocket went up from, and the Pad gives you the specific location within the launch site. Platform is used for mobile sites such as submarines or planes. See (See Launch Sites ) and (See Platforms.)
- **Ascent\_Site and Ascent\_Pad**  
Site and location of the actual rocket launch from a Platform, when different from the Launchite. For air launches, Launchite/Pad give the airport/runway of carrier plane takeoff, and Ascentite/Pad give the drop site location.
- **Apogee** - the highest altitude actually reached, in km. This field may be omitted for orbital launches. In many cases for non-orbital launches the value is a guess based on known capabilities of the launch vehicle, so only values with no appended question-mark should be taken as accurate.
- **Range** - the range in km measured along the curved surface of the Earth between launch site and impact site, for a suborbital launch. I have only recently added this field and very few entries are filled in.
- **Destination (Dest)** - the location of landing/impact of a suborbital flight. At present the values in this field are mnemonics that may or may not be obvious to the reader - sorry, I don't have a table of them at this stage. This is another recently added field and regarded as incompletely supported. Values in parentheses represent intended targets that were not reached due to a failure.

- 
- **Orbital Payload (OPay):** - payload in tonnes delivered to orbit (perigee above 80 km). Current values are autogenerated from the payload tables and there are likely some special cases not treated properly yet. Use with caution for now (2024).
  - **Launch\_Agency:** Organization responsible for launch services (often different from the organization owning the payload). See the (See Organizations database.)
  - **Launch\_Code** field. The first letter is the **launch category** - O for orbital, M for military missile, T for test rocket, A for atmospheric rocket, S for suborbital rocket other than missile, D for deep space mission. Also used occasionally are H (high altitude sounding rocket), R (reentry test), X (launch from world other than Earth), and Y (suborbital spaceplane with human crew). This field should be reliable for categories O and D, but the remaining letters are not always assigned fully consistently. It is mainly intended to separate out orbital and non-orbital launches.

The second letter, possibly followed by digits, is the **launch success fraction** (see the (See definitions section) )

Usually the launch success fraction code is S, F or U for Success, Fail or Unknown. Success implies propulsive success only, even if no data was returned from the payload. Also used is E, for pad explosion (no launch occurred, but included in the lists for completeness).

For orbital launches partial success/failure values are sometimes given, e.g. OS80 or OF40. The values between 00 and 99 indicate a percentage success to be used in statistical assessments of launch vehicle reliability as originally described in JSR 669 (<http://www.planet4589.org/space/jsr/back/news.669.txt>) and here in (See the launch success fraction) part of the definitions section.

- **Group:** For suborbital science missions, indicates the leading organizations responsible for the science payload. Up to 3 are given separated by slashes. Following the last slash is a comma-separated list of names of the principal investigators.

For orbital missions: This field encodes the type of launch service; the values are explained in (See the launch service code) part of the definitions section.

- **Category:** For non-orbital launches: Type of flight. Not necessarily a rigorous set of designations.

For orbital launches: Launch profile code. This records what the target orbit type was, how many upper stages were left in orbit, and what kind of debris mitigation maneuver was carried out for them, if any.

The codes are explained in (See the launch profile code) part of the definitions section.

- **Citation 1 (LTCite):** this citation is the primary reference for the existence of the launch and for the given launch time. See the (See Refs file.)

”Wire” means that the time was taken from wire service stories, internet news sites or live launch broadcasts. I’ve been more careful with recording a specific source where the launch time was hard to find.

- **Citation 2: (Cite)** Additional citation of interest, for example reference for which launch pad was used, etc.

- **Notes:** A field for additional notes. Right now I have rarely used this.

## **Part VII**

# **Worlds of the Solar System**

## Chapter VII.1

# Solar System Model

### VII.1.1 Solar System Description Files

At any given time, an artificial space object is considered to be orbiting a particular astronomical body. In the General Catalog the body is identified by a string identifier (e.g. "Earth"). The bodies and their properties are described in two files, the Worlds file and the Spin file.

### VII.1.2 Preamble: The Hill Sphere

In general, a space object travels under the gravitational influence of all the massive worlds in the system. However, in most cases the effects of all but one body can be neglected or treated as small perturbations. We say that the object is 'in orbit about' that one body. (The orbit is not necessarily bound; it may be a hyperbola rather than an ellipse). I introduce the concept of the Hill sphere of body A with respect to body B.

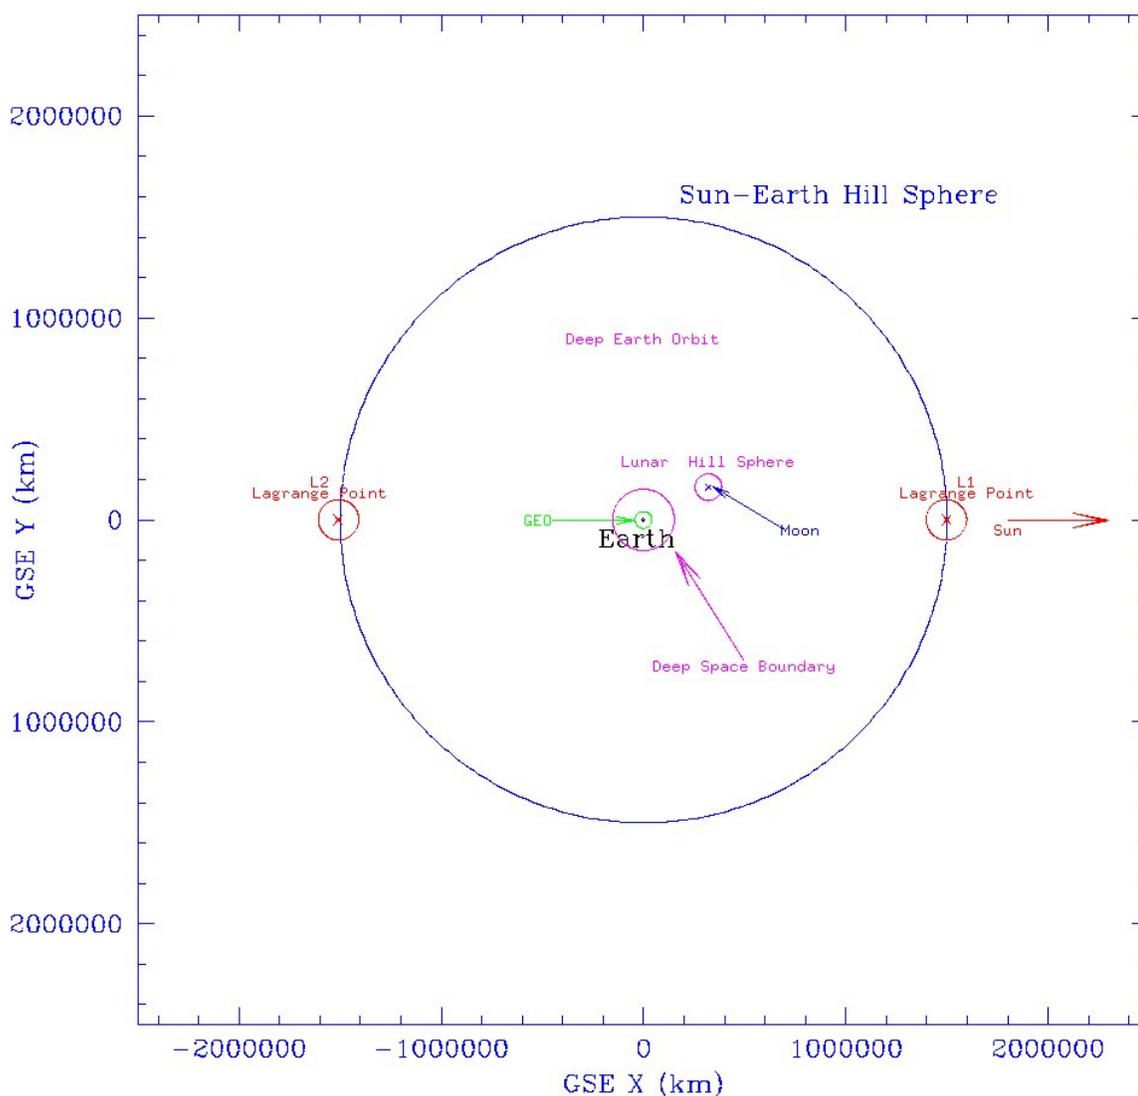

Let the mass of body A be  $M$ , the (smaller) mass of body B be  $m$ , and the distance between A and B be  $R$ . Then B's gravity dominates (in this approximation) when the distance from the object to B is less than

$$r(\text{Hill}) = R \left( \frac{m}{3M} \right)^{1/3}$$

For example, the radius of the Sun-Earth Hill sphere is about 1.5 million km centered on the Earth. The radius of the Earth-Moon Hill sphere is about 66,000 km centered on the Moon, and therefore is entirely within the Sun-Earth sphere.

Here is a map of the Earth-Moon system (with the Moon's position shown on the arbitrary date of 1968 Dec 21), showing the sizes of the two Hill spheres. The map is in geocentric solar ecliptic coordinates in which the Earth-Sun line is fixed and is the X-axis.

## Geography of the Earth-Moon System

The locations for the SEL1 (Sun-Earth Lagrange 1) and SEL2 (Sun-Earth Lagrange 2) points (see below) are also shown. The magenta circle around the Earth indicates the EL1:4 ‘deep space boundary’ beyond which I record space objects in the Deep Space Catalog instead of the main Earth satellite catalog.

### VII.1.3 Worlds in the Solar System

The General Catalog includes data on spacecraft in the vicinity of bodies throughout the Solar System (and, like the Voyagers, on their way to the great beyond).

We consider four kinds of body:

- Stars, of which the only one currently relevant to space travel is the Sun.
- Worlds. A world is a body which is sufficiently massive that it is spheroidal due to its own gravity but not massive enough to be a star. This includes gas and ice giants like Jupiter and Neptune, and terrestrial rocky and icy worlds like Earth and Titan. The majority of worlds are icy bodies beyond Neptune whose sizes are in fact poorly known at the moment.

- 
- Small bodies, solid objects smaller than worlds - asteroids, comets, small moons, and small Trans-Neptunian objects. While the true geophysical boundary between worlds and small bodies depends on composition, for definiteness I treat all substellar bodies with mean radius more than 200 km as worlds. In the list of small bodies used in the catalog, I include a number of the larger ones and all bodies that have been visited by spacecraft.
  - Dynamical reference points, of which we consider two types: subsystem barycenters and Lagrange points.

Objects maintaining position near Lagrange points are recorded in the General Catalog as ‘orbiting’ those points; in all other cases, objects are considered to orbit the body whose Hill sphere they are within. (In the case of nested Hill spheres, we take the innermost sphere the object is within).

### VII.1.3.1 Dynamical Reference Points

First, let’s discuss barycenters.

- The SSB: of greatest importance is the Solar System Barycenter (SSB), the center of gravity of the Solar System. We often choose coordinates in which the planets orbit the Sun (HC, heliocentric coordinates), and that’s what I do for the most part in the General Catalog. But you can instead use a barycentric coordinate (BC) system in which the Sun and the planets jointly orbit the SSB, and this is actually ‘better’ or ‘more correct’ in several senses - for example, BC is closer to an inertial frame, and orbital elements of loosely bound objects like high-eccentricity comets are less time-variable in BC. I went back and forth a few times on this but ultimately decided to stick with object-centered systems (HC and geocentric), partly because it’s conventional to refer Earth satellites to the Earth’s center and not the Earth-Moon barycenter.
- The EMB: the Earth-Moon Barycenter. It is useful to think of the EMB as orbiting the Sun and the Earth and Moon as each orbiting the EMB. (The EMB’s orbit around the Sun is more closely an ellipse, while the Earth’s has wobbles in it due to the Moon).
- Other subsystem barycenters, notably the Jovian and Saturnian systems (whose barycenters, however, are deep within their central planets). These are not explicitly in the attached world list, but are automatically added to the list in software as needed.

Now let’s talk about Lagrange points, which are closely related to the Hill sphere discussed in the previous section. When body B orbits body A, an object orbiting both will be subject to the effects of the gravity of A and B and to the acceleration due to the angular momentum it has with respect to both. Lagrange showed that the net effective forces balance at five points which are the solution of a quintic equation, the Lagrange quintic. We refer to these points as the L1 to L5 points of the A-B system. The Lagrange points for the specific and special A-B cases of Sun-Earth and Earth-Moon are referred to as SEL1 to SEL5 and EML1 to EML5.

- The L1 point lies at the interior intersection between the A-B line and the A-B Hill Sphere. SEL1 is 1.496 million km from the Earth in the direction towards the Sun (i.e. towards noon). SEL1 is useful for probes studying solar wind particles before they reach the Earth.
- The L2 point lies at the exterior intersection between the A-B line and the A-B Hill Sphere. SEL2 is 1.496 million km from the Earth in the direction away from the Sun (i.e. towards midnight). SEL2 is very useful for astronomical observatories. EML2 is being used by the Queqiao communications spacecraft as a farside communications relay point.

The L1 and L2 points are peaks in the effective potential; gravitational forces on objects there are low but nonzero and slowly cause the object to drift away. However, these forces can be counteracted by occasional small thruster firings. In practice spacecraft are placed in large ‘orbits’ around L1 or L2, with radii often in the hundreds of thousands of km for SEL1/2 and maintenance thruster burns every few months. I put the quotes around the word ‘orbit’ since there is of course no central gravitating mass at the Lagrange point, and the paths are not remotely Keplerian. Lagrange trajectories can be either ‘halo orbits’ or ‘Lissajous orbits’, and I hope to finally get around to learning the relevant orbital dynamics some day soon.

- The L3 point lies on the extension of the A-B line through A, roughly at the same distance from A as B is. SEL3 is therefore about 149.6 million km from the Sun and 180 degrees around the Earth's orbit from Earth - it is, roughly, the Anti-Earth. At least so far, the L3 point has not had any particular importance in astronomy or astronautics.
- The L4 and L5 points make an equilateral triangle with A and B, in the plane of the A-B mutual orbit. Unlike L1 to L3, they are gravitationally stable. The first practical example of Lagrange points was the discovery of asteroids at Sun-Jupiter L4 and L5. These asteroids were given names of characters from the Trojan War and became known as Trojan asteroids; the L4 and L5 points are thus also known as 'Trojan points' of any A-B system. Some probes have explored the interplanetary environment near the Earth-Moon L4 and L5 points.

## VII.1.4 Worlds Table Column Descriptions

Each line in the Worlds table represents a world, a small body, or a dynamical point.

The fields in the Worlds table are described below. The important fields are the name, mass, and radius. The orbital data given (columns from SemiMajorAxis through Epoch, and EphPeriod), as well as the RotPeriod, are sample values and it should be noted that the elements are functions of time - especially for moons. In practice, detailed ephemerides such as the JPL data are used to compute the locations of the worlds, and the values in this table are just to give the reader a general idea.

- **ID:** This one or two character string defines what kind of IDName designation the body has. (This also hints what kind of world it is, but that is formally defined in the WType field). The values are described in the next (IDName) paragraph.
- **IDName:** Combined with the ID field, the IDName provides a unique identifier for the body. These are based on the standard astronomical designations for the bodies except for the planets and moons which use the JPL ephemeris codes for the objects. (The identifiers are explained below, but it's fine to treat them as opaque strings rather than parse them).

ID	IDName Format	IDName Examples	Category	Description
P	0nn	006	Planet or Moon	Three digit code. 001-010 are 'planets' including Pluto (9) and the Sun (10).
P	pnn	603		Values 301-999 represent moons. The first digit is the primary and the second is the moon number for that primary, so 603 is the third officially numbered moon of Saturn (Tethys).
DL	ABL <sub>n</sub>	SEL2	Lagrange point	L Point n for the Alpha-Beta system is ABL <sub>n</sub> . The letter abbreviations for the bodies are, however, arbitrary.
A	(nnnn)	(532037)	Numbered minor planet	Value in parentheses is the minor planet number, starting with (1) Ceres.
AP	yyyy ABnnn	2002 TC302	Provisionally designated minor planet	IAU MPC provisional designation code, starting with discovery year.
AS	(nnn) m	(90482) 1	Satellite of minor planet	moon number m of asteroid nnn is (nnn) m.
C	nnP/	21P/	Comet	Comet designations ending in P/ are numbered periodic comets.
C	C/yyyy An	C/2017 S8	Comet	Comet designations starting C/ or D/ are 'unnumbered' non-periodic comets.

- **Name:** Name of the body. This name is used to identify the central body around which an object is orbiting in the General Catalog object catalogs and in the XTLE (extended TLE) orbit data files.
- **AltName:** Alternate name of the body. Either the formal designation with respect to the object's primary (e.g. Earth is Sol III) or an asteroid provisional designation.

- **Radius:** The equatorial radius of the body in km. A trailing question mark indicates an uncertain estimate.
- **Polar radius:** Polar radius of the body in km, where known.
- **Mass:** Mass of the body in teratonnes (1E15 kg, or 1E18g). A trailing question mark indicates an uncertain estimate. A trailing letter M (for million) indicates the numerical value should be multiplied by 1,000,000.
- **SemiMajorAxis:** Semi-major axis (orbital radius) of the body's orbit around its primary, in km. A trailing question mark indicates an uncertain estimate. A trailing letter M (for million) indicates the numerical value should be multiplied by 1,000,000.
- **Periapsis:** Periapsis (minimum orbital radius) of the body's orbit around its primary, in km. Note that for comets, the periapsis is often much more accurately known than the semi-major axis. A trailing question mark indicates an uncertain estimate. A trailing letter M (for million) indicates the numerical value should be multiplied by 1,000,000.
- **Ecc:** Orbital eccentricity at the given epoch.
- **Inc:** Orbital inclination at the given epoch. Moon orbits given with respect to planetary equator. Heliocentric orbits given with respect to the J2000 ecliptic.
- **Node:** Longitude of ascending node at the given epoch. Moon orbits given with respect to planetary equator. Heliocentric orbits given with respect to the J2000 ecliptic.
- **Peri:** Argument of periapsis at the given epoch.
- **M:** Mean anomaly at the given epoch.
- **Epoch:** Epoch of the sample orbital elements (SMA, periapsis, ecc, inc, node, peri, M).
- **RotPeriod:** Rotation period of the body in days. (More detailed information given in the Spin file).
- **OrbPeriod:** Orbital period of the body in days.
- **Ephemeris:** A string which encodes which ephemeris should be used to supersede the given orbital elements. Currently, JPL ephemeris files are used (DE405 for the planets and SPICE files for the moons.)
- **WType:** Body (world) type. Types used are:

WType	Meaning
*	Star
A	Minor planet (asteroid)
AS	Asteroid satellite (moon of asteroid)
DB	Barycenter dynamical point
DL	Lagrange dynamical point
M	Small moon
P	Major planet
W	World (but not major planet)
CP	Periodic comet
C	Comet

- **Primary:** Central body which this body is orbiting. When not given, it is assumed the central body is the Sun. The string EMB is an alternate name accepted for 'Earth-Moon System', the body entry from the Earth-Moon barycenter.

## VII.1.5 Spin File Column Descriptions

Each line in the Spin table represents a body defined in the Worlds file, and gives additional information on the rotational properties of the body. The Spin and Worlds files are linked by the ID and IDName columns (and also by the Name column, but that is not guaranteed to be unique).

- **ID:** This one or two character string defines what kind of IDName designation the body has.
- **IDName:** Combined with the ID field, the IDName provides a unique identifier for the body. See the ‘worlds file’ column descriptions for details.
- **Name** Body name.
- **Rho** Body mean density in units of 1000 kg/cubic metre (i.e. in grams per cc).
- **IFac** Inertial factor. This dimensionless factor  $f_I$  relates the total angular momentum of the body to the product of its mass times radius squared,

$$I = f_I M r^2$$

Where no information is available, a default value of 0.33 is used.

- **PoleRA, PoleDec** Celestial ICRS position in degrees of the direction of the body’s north pole at J2000.0.
- **Meridian** Longitude of planetary meridian at J2000.0, degrees.
- **SpinRate** Rate of change of longitude at J2000.0, degrees per day.
- **J2, J4, J6** J2, J4 and J6 spherical harmonics multiplied by one million.
- **PoleRARate, PoleDecRate** (degrees/d). Rate of change of ICRS polar RA and Dec at epoch J2000.
- **PoleFunc** A code indicating to software which subroutine to use for detailed polar motion function. This and the succeeding functions are based on the Report of the IAU Working Group on Cartographic Coordinates and Rotational Elements 2015 (and later revisions).
- **SpinFunc** A code indicating to software which subroutine to use for detailed spin rate function.
- **InitFunc** A code indicating to software which subroutine to use for detailed perturbation functions for the body’s moons.
- **JFile** Filename containing higher order spherical harmonics for the body. Currently only the Earth has such a file. Its contents are:

Coefficient	Value * 1 million
J2	1082.635854
J3	-2.532435346
J4	-1.619331205
J5	-0.2277161016
J6	0.5396348906

## VII.1.6 Worlds Table Column Descriptions

Each line in the Worlds table represents a world, a small body, or a dynamical point.

The fields in the Worlds table are described below. The important fields are the name, mass, and radius. The orbital data given (columns from SemiMajorAxis through Epoch, and EphPeriod), as well as the RotPeriod, are sample values and it should be noted that the elements are functions of time - especially for moons. In practice, detailed ephemerides such as the JPL data are used to compute the locations of the worlds, and the values in this table are just to give the reader a general idea.

- **ID:** This one or two character string defines what kind of IDName designation the body has. (This also hints what kind of world it is, but that is formally defined in the WType field). The values are described in the next (IDName) paragraph.

- **IDName:** Combined with the ID field, the IDName provides a unique identifier for the body. These are based on the standard astronomical designations for the bodies except for the planets and moons which use the JPL ephemeris codes for the objects. (The identifiers are explained below, but it's fine to treat them as opaque strings rather than parse them).

ID	IDName Format	IDName Examples	Category	Description
P	0nn	006	Planet or Moon	Three digit code. 001-010 are 'planets' including Pluto (9) and the Sun (10).
P	pnn	603		Values 301-999 represent moons. The first digit is the primary and the second is the moon number for that primary, so 603 is the third officially numbered moon of Saturn (Tethys).
DL	ABLn	SEL2	Lagrange point	L Point n for the Alpha-Beta system is ABLn. The letter abbreviations for the bodies are, however, arbitrary.
A	(nnnn)	(532037)	Numbered minor planet	Value in parentheses is the minor planet number, starting with (1) Ceres.
AP	yyyy ABnnn	2002 TC302	Provisionally designated minor planet	IAU MPC provisional designation code, starting with discovery year.
AS	(nnn) m	(90482) 1	Satellite of minor planet	moon number m of asteroid nnn is (nnn) m.
C	nnP/	21P/	Comet	Comet designations ending in P/ are numbered periodic comets.
C	C/yyyy An	C/2017 S8	Comet	Comet designations starting C/ or D/ are 'unnumbered' non-periodic comets.

- **Name:** Name of the body. This name is used to identify the central body around which an object is orbiting in the General Catalog object catalogs and in the XTLE (extended TLE) orbit data files.
- **AltName:** Alternate name of the body. Either the formal designation with respect to the object's primary (e.g. Earth is Sol III) or an asteroid provisional designation.
- **Radius:** The equatorial radius of the body in km. A trailing question mark indicates an uncertain estimate.
- **Polar radius:** Polar radius of the body in km, where known.
- **Mass:** Mass of the body in teratonnes (1E15 kg, or 1E18g). A trailing question mark indicates an uncertain estimate. A trailing letter M (for million) indicates the numerical value should be multiplied by 1,000,000.
- **SemiMajorAxis:** Semi-major axis (orbital radius) of the body's orbit around its primary, in km. A trailing question mark indicates an uncertain estimate. A trailing letter M (for million) indicates the numerical value should be multiplied by 1,000,000.
- **Periapsis:** Periapsis (minimum orbital radius) of the body's orbit around its primary, in km. Note that for comets, the periapsis is often much more accurately known than the semi-major axis. A trailing question mark indicates an uncertain estimate. A trailing letter M (for million) indicates the numerical value should be multiplied by 1,000,000.
- **Ecc:** Orbital eccentricity at the given epoch.
- **Inc:** Orbital inclination at the given epoch. Moon orbits given with respect to planetary equator. Heliocentric orbits given with respect to the J2000 ecliptic.
- **Node:** Longitude of ascending node at the given epoch. Moon orbits given with respect to planetary equator. Heliocentric orbits given with respect to the J2000 ecliptic.
- **Peri:** Argument of periapsis at the given epoch.
- **M:** Mean anomaly at the given epoch.
- **Epoch:** Epoch of the sample orbital elements (SMA, periapsis, ecc, inc, node, peri, M).

- **RotPeriod:** Rotation period of the body in days. (More detailed information given in the Spin file).
- **OrbPeriod:** Orbital period of the body in days.
- **Ephemeris:** A string which encodes which ephemeris should be used to supersede the given orbital elements. Currently, JPL ephemeris files are used (DE405 for the planets and SPICE files for the moons.)
- **WType:** Body (world) type. Types used are:

WType	Meaning
*	Star
A	Minor planet (asteroid)
AS	Asteroid satellite (moon of asteroid)
DB	Barycenter dynamical point
DL	Lagrange dynamical point
M	Small moon
P	Major planet
W	World (but not major planet)
CP	Periodic comet
C	Comet

- **Primary:** Central body which this body is orbiting. When not given, it is assumed the central body is the Sun. The string EMB is an alternate name accepted for 'Earth-Moon System', the body entry from the Earth-Moon barycenter.

## VII.1.7 Spin File Column Descriptions

Each line in the Spin table represents a body defined in the Worlds file, and gives additional information on the rotational properties of the body. The Spin and Worlds files are linked by the ID and IDName columns (and also by the Name column, but that is not guaranteed to be unique).

- **ID:** This one or two character string defines what kind of IDName designation the body has.
- **IDName:** Combined with the ID field, the IDName provides a unique identifier for the body. See the 'worlds file' column descriptions for details.
- **Name** Body name.
- **Rho** Body mean density in units of 1000 kg/cubic metre (i.e. in grams per cc).
- **IFac** Inertial factor. This dimensionless factor  $f_I$  relates the total angular momentum of the body to the product of its mass times radius squared,

$$I = f_I M r^2$$

Where no information is available, a default value of 0.33 is used.

- **PoleRA, PoleDec** Celestial ICRS position in degrees of the direction of the body's north pole at J2000.0.
- **Meridian** Longitude of planetary meridian at J2000.0, degrees.
- **SpinRate** Rate of change of longitude at J2000.0, degrees per day.
- **J2, J4, J6** J2, J4 and J6 spherical harmonics multiplied by one million.
- **PoleRARate, PoleDecRate** (degrees/d). Rate of change of ICRS polar RA and Dec at epoch J2000.
- **PoleFunc** A code indicating to software which subroutine to use for detailed polar motion function. This and the succeeding functions are based on the Report of the IAU Working Group on Cartographic Coordinates and Rotational Elements 2015 (and later revisions).
- **SpinFunc** A code indicating to software which subroutine to use for detailed spin rate function.

- 
- **InitFunc** A code indicating to software which subroutine to use for detailed perturbation functions for the body's moons.
  - **JFile** Filename containing higher order spherical harmonics for the body. Currently only the Earth has such a file. Its contents are:

Coefficient	Value * 1 million
J2	1082.635854
J3	-2.532435346
J4	-1.619331205
J5	-0.2277161016
J6	0.5396348906

**Part VIII**

**Object Catalogs**

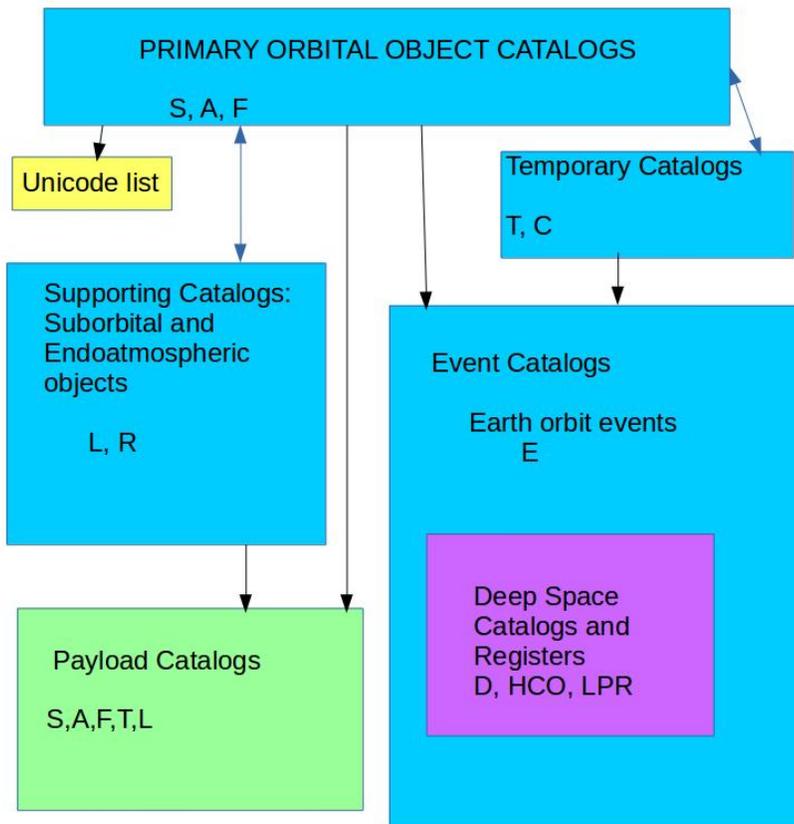

## **Chapter VIII.1**

# **Main Object Catalogs**

### **VIII.1.1 Object Catalogs Organization**

The General Catalog of Artificial Space Objects has eleven object catalogs and five payload catalogs, each with a different role. The object catalogs, while containing different groups of objects, all have the same format - from a relational database point of view, they could be concatenated into a single table without loss of information. The same is true of the payload catalogs. Nevertheless, I find it clearer to keep the catalogs separated.

The diagram below shows the interrelations between the different catalogs. Each payload catalog is paired with an object catalog, but not all the object catalogs have payload catalogs. The various catalogs are summarized in the table below. I then discuss each catalog in general terms, and finally explain the catalog columns.

Object Catalog	Full name	Object prefix	Description
<b>Primary Orbital Object Catalogs</b>			
satcat	Standard Satellite Catalog	S	Objects from the US Satellite Catalog
auxcat	Auxiliary Satellite Catalog	A	Objects omitted from the US catalog
ftocat	Failed Satellite Catalog	F	Objects which failed to reach orbit
<b>Supporting Catalogs</b>			
lcat	Low Altitude (Endoatmospheric) Catalog	L	Objects whose apogee was less than 80 km
rcat	Suborbital Rocket (Exoatmospheric) Catalog	R	Objects whose apogee was 80 km or more
<b>Temporary Catalogs</b>			
tmpcat	Temporary Catalog	T	Objects expected to receive an S catalog number
csocat	Complementary Space Object Catalog	C	Observed objects whose mapping to S is uncertain
<b>Event Catalogs</b>			
ecat	Event Catalog		Later phases in history for objects in primary catalogs
deepcat	Deep Space Catalog	D	Objects which reached more than 150,000 km
hcocat	Heliocentric Register	D	Objects in heliocentric orbit
lprcat	Lunar and Planetary Register	D	Objects in sphere of influence of other worlds
<b>Payload Catalogs</b>			
psatcat	Payload catalog	S	Payload data for payloads in satcat
pauxcat	Payload catalog	A	Payload data for payloads in auxcat
pftocat	Payload catalog	F	Payload data for payloads in ftocat
plcat	Payload catalog	L	Payload data for payloads in lcat
prcat	Payload catalog	R	Payload data for payloads in rcat
pdeepcat	Payload catalog	D	Payload data for payloads in deepcat which are not in primary catalogs
<b>Derived Catalogs</b>			
currentcat	Summary catalog	S/A	Most recent phase for each S and A object, v

---

## Chapter VIII.2

# Main Object Catalogs

### VIII.2.1 Primary Orbital Object Catalogs

#### VIII.2.1.1 The Standard (S) Satellite Catalog

Since the late 1950s the US government has maintained a catalog of satellites (often referred to as the SATCAT). Each satellite is given a sequential number (1 was the rocket stage from the first Sputnik). These numbers are sometimes referred to as SSN numbers.

In GCAT, each entry in the S catalog (Standard Satellite Catalog or satcat) corresponds directly to the corresponding entry in the US catalog; entry S00001 corresponds to SSN 1, entry S40000 corresponds to SSN 40000. The S catalog contains additional metadata not present in the US catalog, described later in this chapter. Note that I will use SATCAT in upper case to refer to the US catalog, while the lower case version will always refer to GCAT's S catalog.

By convention I render entries 1-99999 in each catalog with 5 digits, in this case S00001 to S99999. I then jump to 9 digits for objects 000100000 onwards (S000100000 in this case). I am optimistic that we won't reach S999999999 before I retire, so that'll be Somebody Else's Problem.

There are, as always, complications. Not infrequently, the SSN numbers associated with two space objects are swapped, or an SSN number is reassigned to a different object and the previously assigned object is now not in the catalog. However, archival TLE (Two Line Element) sets for the previous object remain associated with the same catalog number, potentially causing confusion. Although I would rather not reassign numbers, in the interests of practical compatibility the S catalog entry corresponds to the object MOST RECENTLY ASSOCIATED with that catalog number (and the GCAT is updated as required to reflect this).

The SSN number is really associated with an object tracked by the US space tracking team (currently the 18th Space Control Squadron and associated organizations). The set of TLEs associated with that catalog number, for the most part, define the SSN. The association of that catalog number with a physical object (satellite, rocket, debris) is an inference. Sometimes I disagree with the association made, and the S catalog reflects that. The harder problem is when you have, say, 3 SSN tracked objects and three known payloads, but you have no idea which is which. This can occur, for example, when three externally similar cubesats deployed from the same vehicle immediately fail, so even the satellite owners don't know which is which. In this case the SATCAT will just have them as 'OBJECT C', etc., and not attempt to make an identification. I prefer to make an arbitrary assignment of the three objects to catalog numbers but flag the assignments as uncertain. This lets me enter all the metadata such as country, owner, name etc. and so statistical counts such as number of payloads associated with a given country will come out right.

Some satellites are made up of several attached sections. When I deem that these separate sections are of sufficient interest to deserve their own catalog entry (for example because their metadata are interestingly different) I create additional entries in the auxcat (see below), and choose one of the sections to be associated with the S entry. As an example, for CORONA satellites both the CORONA payload and the attached Agena rocket stage, as well as

---

any Agena aft rack attached payloads, get catalog entries. In such cases the S entry is given to the payload; metadata includes the information that the CORONA and the Agena remained attached until reentry.

The SATCAT associates debris objects with a particular launch but does not identify them in detail; again, I make my best guess as to the nature and origin of particular debris objects.

The US catalog is coy about certain military and intelligence satellites belonging to the US and its allies. Usually a cover name (e.g. USA 304) and a launch date are provided, but no orbital data or reentry date. Since I do not have access to secret information, I am free to speculate. Usually it's not very hard and identifications of secret satellites with particular programs and orbits mostly have a high degree of confidence.

### **VIII.2.1.2 The Auxiliary (A) Satellite Catalog.**

The auxcat contains entries for objects not in the standard catalog. The catalog numbers have the prefix 'A', so the first entry is A00001.

Objects end up in the A catalog for a variety of reasons:

- Object should have been in S catalog but was omitted (not tracked, or administrative oversight)
- Object is attached to another object (see discussion in S catalog section) Some special cases include Shuttle payload bay cargo items, external ISS components, and internal ISS cargo entries used for mass accounting.
- Object was in orbit, with perigee well above the atmosphere, but was deorbited after less than a full orbit.
- Object had positive perigee but reentered on first object.
- Object had mildly negative perigee. This includes some rocket stages (e.g. Ariane core stages) and some objects released during reentry of spacecraft (discarded service modules, parts of film recovery capsules). I like to perturb the boundaries of definitions and see what falls in. These objects don't strictly count as satellites by my rules, but they are 'close enough' to be interesting.
- Objects with greater total energy per unit mass than a low orbit satellite. This includes some high apogee (above 10,000 km) suborbital flights and some high velocity reentry tests.

Sometimes objects already in the A catalog get a US SATCAT number - for example, external ISS experiments which are unexpectedly discarded into orbit at the end of their lives. In this case the object is moved to the S catalog, and its A catalog number is retired. In previous internal use of the catalog I've reused such freed A catalog entries, but with the formal release of GCAT it is my intent that any such reassignments will be recorded formally and the empty catalog entries will not be reused.

When it is clear that an object is likely to receive a SATCAT number in the near future, it is placed in the T catalog (see below) instead of the A catalog.

### **VIII.2.1.3 The Failure To Orbit (F) Satellite Catalog**

The ftocat (F, Failure to orbit catalog) contains objects from failed launches which were expected to have had satellite catalog entries if the launch had been successful. The objects are upper stages and payloads from launches with 'F' launch designations (e.g. 1959-F01).

Note that objects from 'U' marginal-orbit launches (1959-U01 etc) are in the auxcat rather than the ftocat. Objects from pad explosions ('E' launches where no actual launch occurred) are in the lcat.

I have gone to some trouble to estimate the best-guess suborbital perigee, apogee and inclination for the objects in the F catalog. If you have better data for a particular launch, please let me know.

---

## VIII.2.2 Supporting Catalogs

The two supporting catalogs are relatively less complete and are of variable data quality, as described below. *Caveat emptor - maxime quando sine sumptu est!*

### VIII.2.2.1 The Rocket (R) and Suborbital Object Catalog

The rcat contains objects whose apogee was probably above 80 km but which did not reach orbit (i.e. are not included in the orbital catalogs). The main purpose of the rcat is to record suborbital stages of orbit launch vehicles, allowing me to specify the detailed configuration of that particular flight vehicle - it gives me a place to put the type and serial number of the stages. Other metadata - mass, size, (sub)orbital parameters - are sometimes included but typically with approximate or guessed values. Orbital inclination values of zero should be ignored.

Object associated with suborbital launches are also included. The catalog is not complete in this respect and the caveats on the quality of the metadata for such objects apply even more strongly. But it gives me a place to store parameters of sounding rocket and missile payloads when I know them.

### VIII.2.2.2 The Low-altitude (L) Endoatmospheric Object Catalog

The lcat contains objects whose apogee was probably below 80 km. Like the rcat, the main purpose of the lcat is to record the stage configuration of orbital launches, serving as a place to store the details of lower stages (first stage, strap-on boosters, etc) that did not leave the atmosphere. As for the rcat, but even more so, metadata on mass, size and trajectory are approximate or guessed and should usually be treated with skepticism. (For a few cases, such as Apollo-Saturn lower stages, the data are accurate.)

Mostly the lcat is used to store low altitude objects associated with a launch which also had exoatmospheric parts. However, some objects associated with purely endoatmospheric and mesospheric launches are included. Nevertheless, the presence of a low altitude launch in the launch lists does not guarantee its associated objects will exist in the lcat.

As noted above under ftoicat, objects from launches which exploded on the pad are also included in the lcat.

## VIII.2.3 Temporary Catalogs

Unlike the main catalogs, the catalog numbers in the T and C catalogs are not assigned sequentially. Currently the first object in the C catalog is C00100.

The tmpcat contains objects which are (1) in orbit, and (2) do not have US satellite catalog numbers but are expected to get them in the fairly near future. This usually means objects which are aboard the ISS or a cargo ship and slated for later deployment, such as cubesats to be ejected from the Kibo module; or subsatellites to be ejected from another satellite; or objects such as the Crew Dragon Trunk which is left in orbit at the end of a Crew Dragon mission. Starlink and other megaconstellation satellites may also receive T numbers based on the 70000-series numbers used by Celestrak Supplemental TLEs before identifications are made with the SATCAT numbers.

When the T catalog object does get a US SATCAT number, its GCAT identifier is changed. The object is added to the S catalog, and its T catalog number is removed (and later reassigned). Users should therefore beware of referring to T catalog numbers - they are ephemeral and their reassignment is not formally recorded. They are a compromise, allowing the instantaneous catalog to reflect the state of things as well as possible, while avoiding reassigning any 'permanent' catalog entries.

Objects which may never get catalog numbers - such as known objects which nevertheless have not been tracked - are instead put in the auxcat as described above.

---

### VIII.2.3.1 The Complementary Space Object (C) Catalog

The csocat (C catalog) is a rather different construct. The objects here are those detected and observed by someone other than the US space tracking network, and not immediately identified with an existing SATCAT entry. These include objects found by hobbyist observers, astronomers, and non-US satellite tracking groups. ‘Analyst objects’ from the US space tracking network are also included.

(I will admit that the ‘C’ originally stood for Canadian Space Society, the initial source of hobbyist TLEs in the 1990s thanks to Ted Molczan).

Since the objects in the C catalog may or may not be also present in the S catalog, I do not include C catalog objects in my statistical summaries (of numbers of satellites launched, etc.).

C catalog entries are initially assigned the value NNA (No Number Assigned) in the Satcat number field (see column descriptions). Then, when and if a C catalog object is later identified with an S catalog entry, the actual SATCAT number is placed in the field to flag that the object is no longer ‘unaffiliated’. The user may therefore ignore all C catalog entries whose Satcat number is not ‘NNA’.

Types of objects in the C catalog include (with catalog number ranges used as of mid-2020, but not guaranteed to be rigidly adhered to):

- (C00100-C00399) Objects found by Near-Earth asteroid astronomers and cataloged by Bill Gray (project-pluto.org) PThese include distant space junk but also some natural asteroids.
- (C10000-C29999) Objects found by the ISON and Vimpel networks in Russia
- (C70000-C79999, C90000-C99999) Objects found by hobbyist observers (satobs.org) and cataloged by Ted Molczan, Mike McCants and colleagues.
- (C80000-C89999) ‘Analyst objects’ from Space-Track.org given temporary satellite catalog numbers. The entry in the C catalog has the same catalog number as assigned by Space-Track, but with the C prefix. These numbers generally are between 80000 and 90000 (although some have occurred in the 70000s.)

Since the objects in the C catalog are often of unknown origin, the launch dates and international designations in the catalog are meaningless and should be ignored. The orbital metadata, however, are based on actual data.

### VIII.2.4 Event Catalogs

The event catalogs consist of the main Event Catalog, for Earth orbiting objects, and the deep space catalogs which are only briefly discussed here.

#### VIII.2.4.1 The Event Catalog

The SATCAT data model is basically that launches put a set of objects in orbit at a given date (launch date), some of which eventually (decay date) reenter. The structure of the main GCAT object catalogs adds the idea that objects associated with a launch don’t all appear on the launch date, but may instead separate from one of the other objects at a later (sep date) time. This model covers the vast majority of objects in the catalog, but some have more complex histories. The Event Catalog (ecat) is an attempt to accommodate those more complex histories.

We introduce the idea that each object in GCAT has a history composed of multiple ‘phases’. A new phase typically begins with either separation from a parent or attachment to a new parent. Parents may be GCAT objects or GCAT bodies (worlds). Another kind of phase is less physical: the object changes critical metadata - either its name or its owner. For a typical object, there is only one phase, which begins with separation from the parent object and ends with reentry - or is still in progress. But for some objects there are many phases involving renaming, on-orbit resale, docking and undocking, some other form of attachment to another object (e.g. EVA assembly), bringing inside or outside a space station, entering deep space, entering or leaving the gravitational sphere of influence of a

---

new central body, landing or taking off from such a body, or returning to the Earth-Moon system. Each such phase can be characterized by:

- - A parent (GCAT object or body)
- - Phase start time
- - Phase end time
- - Event that ends the phase
- - New parent or destination at phase end

All of this information is conveniently represented in a record identical to the normal satellite catalog entries. Thus, objects with multiple phases are represented by multiple entries with the same catalog identifier; each entry represents a phase. So that this complexity can be ignored when not useful, the main object catalogs contain only a single entry for each object, the first phase. Second and subsequent phases are stored in the *ecat*. The *ecat* records are in chronological order, although this is mainly for my convenience. Thus for example GCAT object A07959 has five phases, leading to one entry in *auxcat* and four entries in *ecat*.

The details of phases are captured in the phase-ending event type, which is stored in the 'status' field of each phase record. The various options are defined in detail in the status column description.

#### **VIII.2.4.2 The Deep Space Catalog**

Objects which pass the EL1:4 deep space boundary at about 150,000 km from Earth are given a 'D' catalog designation in addition to their entries in the S or A catalogs. The S or A catalog uses the decay date, status and destination fields to record the object's transition to deep space and its new catalog number. The corresponding DeepCat entry records the object's arrival in deep space and its departure to its next phase - reentry, entry to the lunar sphere of influence, or departure from the Earth-Moon system. The Heliocentric Register and the Lunar and Planetary Register then record subsequent phases of the object as it visits different bodies in the solar system, using its D catalog designation.

I recognize that the reassignment of a new catalog number to an object once it leaves Earth orbit may be inconvenient. A crossindex between D designations and S/A designations is provided at ([See https://planet4589.org/space/gcat/data/cat/deepindex.html](https://planet4589.org/space/gcat/data/cat/deepindex.html))

The research behind the separate release of the Deep Space Catalog is discussed more fully at <https://planet4589.org/space/deepcat> (<https://planet4589.org/space/deepcat>). While I consider it a part of the General Catalog of Artificial Space Objects, it is a relatively self contained subset and is documented and published on an independent release schedule. The *deepcat* files within GCAT are kept more up to date.

#### **VIII.2.5 Payload Catalogs**

A lot of the metadata I track for satellite payloads (end of operation date, payload category, UN registration information, etc.) is not relevant for debris objects. To save space in the main catalogs, I pull out this extra information into separate 'payload catalogs'. Each object from the main catalogs has zero or one record in the corresponding payload catalog.

For example, GCAT object A00489 appears in the main catalog 'auxcat'. It also has a record in the corresponding payload catalog 'pauxcat' with the additional payload metadata. The payload catalogs have the same name as the corresponding main catalog, except with a leading 'p', so it's pretty easy.

The payload catalogs are *psatcat*, *pauxcat*, *pftocat* and *ptmpcat*. In addition there is a *plcat* corresponding to the *lcat*, containing limited payload info for a few payloads for launches which exploded on the pad and so didn't make it into *focat*, and similarly *prcat* and *pdeepcat* for some special cases in *rcat* and *deepcat*.

---

Of greatest interest is probably the end-of-life date information in psatcat, since a comprehensive satellite operational lifetime dataset has never before been published. The psatcat also is useful for statistical analyses since it characterizes satellites as nonprofit, commercial, civil or defense, and as communications, imaging, navigation, science, etc.

## VIII.2.6 Unicode list

The usatcat file contains a list of satellite names in unicode with the corresponding GCAT catalog numbers. Only objects whose name is not in the Latin alphabet are included. This data should really just be an additional column in the payload or object catalogs but some of my older data entry software isn't completely smooth in the way it handles unicode, so it was easier for me to keep the unicode data separately in a dedicated file.

The file is a simple text file with two columns, the GCAT catalog identifier and the unicode satellite name. It is in alphabetical order of GCAT identifier, so auxcat entries precede satcat ones.

## VIII.2.7 Derived Catalogs

### VIII.2.7.1 Current Catalog

The currentcat file is provided as a useful subset of GCAT. It is largely derived from the information in satcat, auxcat and ecat. There is one record for each entry in satcat and auxcat; it is the **most recent** phase for each object. In the main GCAT, if you want to know the current state of an object in satcat, you also have to check through all its records in ecat to find the final one. I decided this is such a common use case that I'd do the work for you and make a 'most recent phase' catalog.

The catalog contains a subset of the fields in satcat, and a couple of new fields: the **Active flag** which is 'A' if the object is a currently active payload, and the first character of SatType (i.e. P for payload, R for rocket, C for component or D for debris) otherwise. and the **extended status** field which decodes the Status field information into a more readable text field.

Space probes have two catalog IDs, the regular JCAT for their near-earth launch phase and a Deep Space Catalog ID beginning with 'D'. The currentcat has a DeepCat column which gives the 'D' identifier for the object if one exists, corresponding to the object's JCAT field in the deepcat file.

There is one set of data not in the other catalogs: for objects currently in Earth orbit, the most recent available orbital data are provided in currentcat rather than the 'canonical' early orbit data provided in, e.g., satcat.

### VIII.2.7.2 Launchlog File

The LaunchLog file is a list of all orbital launch attempts in chronological order. The data are extracted from the launch lists and the payload catalogs. It joins the launch and payload information to have one line per orbital payload with the payload name and the launch information. It replaces and supersedes the earlier launchlog.txt file on my site.

## VIII.2.8 Object Catalog Column Descriptions

- The first few fields (JCAT, Satcat, Piece, Type, Name, PLName, LaunchDate) identify the object and name it.

---

– **JCAT**

The General Catalog (GCAT) uses an alphanumeric identifier (JCAT, originally Jonathan’s Catalog ID) to uniquely tag space objects. The identifier consists of a single prefix letter followed by a sequence number with either 5 or 9 digits (examples: A00022; S101234009). The 9 digit case is not yet in use, but is supported in anticipation of the introduction of 9-digit SATCAT numbers by the US DoD.

The leading letter tells you which object catalog the object belongs to, as follows:

JCAT letter	Catalog
A	auxcat (Auxiliary catalog)
C	csocat (Complementary catalog)
D	deepcat (Deep space catalog)
F	focat (Failed to orbit catalog)
L	lcat (low altitude catalog)
R	rcat (suborbital catalog)
S	stdcat (Standard catalog)
T	tmpcat (Temporary catalog)

Note that there are no prefix letters associated with the ecat (event catalog), or the heliocentric and lunar-planetary registers, since they contain only objects already defined in the other catalogs.

Sequence numbers in the A, D, F, L, R, and S catalogs are assigned sequentially starting with 00001. However, occasional numbers may be missing due to deletions of spurious or reassigned entries.

Sequence numbers in the C and T catalogs are not assigned sequentially.

Sequence numbers in the S catalog are in one-to-one correspondence with the US SATCAT catalog numbers. Thus, S46112 corresponds to SATCAT satellite 46112 (2020-056A).

In exceptional cases, future releases of GCAT may reassign existing catalog numbers. Any such reassignments will be recorded explicitly in an accompanying table. However, users who have found earlier (pre-GCAT) JCAT catalog numbers that crept into my public files have no such guarantee - in particular, auxcat numbers previously seen in public files may now refer to different objects.

– **Satcat**

For objects in the US Satcat, this field contains an integer value which is the US SATCAT number. In the S catalog, this will be the same as the JCAT sequence number.

However, one US SATCAT number can correspond to multiple GCAT objects which are attached to one another. For example, SATCAT number 00032 corresponds to GCAT objects S00032 (Discoverer 11 payload), A00046 (Agena 1055 rocket stage), and A00047 (TOD experiment attached to Agena stage). All these objects have 00032 in the Satcat field.

Objects which do NOT have US SATCAT entries instead have a string in this field explaining why they don’t.

Value	Meaning
NNA	No (satcat) Number Assigned. Object should be in SATCAT but is not.
NNA A	No SATCAT number because remained attached to parent object
NNA C	No SATCAT number, component of complex object such as space station
NNA E	No SATCAT number because is an EVA spacesuit. These do not get recorded in SATCAT.
NNA I	No SATCAT number because object remained inside parent object
NNA P	No SATCAT number because completed less than one full orbit
NNA R	No SATCAT number because separated into marginally suborbital trajectory during parent reentry.
NNA S	No SATCAT number because launched into marginally suborbital trajectory
NNA T	Not in SATCAT because object was a separate object in orbit transiently, for only a few seconds (e.g. CORONA film capsule)
NNA X	Not in SATCAT because launch is a marginal orbit case
NSO	No SATCAT number because suborbital

- **Piece** The piece designation for the object. For objects in the US SATCAT this is the COSPAR (International) designation (e.g. 2020-032A). See the section on launch and piece designations in ‘definitions and conventions’ for details.

- **Type**

This field contains a SatType string as defined in the (See SatType section.)

This field tells you something about what kind of object this is. At the coarsest level, we characterize the object as payload (P), rocket stage (R), component (C) or debris (D). A component is a functional part of the spacecraft or rocket that is deliberately or accidentally ejected - a fairing, for example. A debris object in this sense is a fragment from a satellite breakup, usually accidental - although fragments from deliberate explosions or collisions are included in this category.

At a finer level the type string provides a lot more information for special cases. See the (See SatType definition) for more details.

- **Name** My recommended name for the object. The name is based on that used by the owner/operator of the object. In cases where the original name is in a non-Latin character set, see the associated (See GCAT unicode name list ) for a representation of the name in Unicode.

‘X part’ indicates that the object is an unidentified component that separated from X. ‘deb X’ indicates the object is a debris object from the breakup of X.

- **PLName**

The PLName (Payload Name) is an alternative name for the object. When available, it is the name used prior to launch by the manufacturer.

Some debris objects have a string with RCS followed by a number in the PLName field. This refers to the radar cross section in square metres. The RCS values obtained from early 2000s era SATCAT releases are unreliable, but may indicate which objects are particularly small or large.

Some objects have a PLName beginning with the string ‘[UNID]’. These objects are marked with an asterisk in the US SATCAT. They are unidentified debris objects; their piece designations (international designations) are believed to associate them with the wrong launch. For example, there are a lot of small component debris objects associated with Soviet Strela-2M communications satellites in rather similar

---

orbits. When such an object is discovered years after its launch, the effects of drag and perturbations are such that while it is obvious from the orbit that the object comes from a Strela-2M, there's no way to tell exactly which Strela-2M it is from.

– **LDate** (Launch Date).

The launch date is given in UTC, with 1 day precision. More accurate launch times are given in the launch lists. Usually you can map the object to a launch using the international designation, but see the discussion in the Parent field below for exceptions.

- The next set of fields (Parent, SDate, Primary, DDate, Status, Dest) describe the current 'phase' of the object.

– **Parent** The Parent field can be either

- \* the 'parent object' which the object is attached to at the start of the phase, or
- \* the central body whose gravitational sphere the object is leaving at the start of the phase.

The parent object is an (See Extended JCAT Identifier) - it's usually just a JCAT ID but sometimes there's a port location appended to make it more specific.

Also, in some cases an asterisk is appended to the identifier. This is a flag that the launch designation in the Piece field is not what you'd expect from the launch designation of the parent. In the normal situation, for example, S45920 has Piece designation 2020-048A, and its parent S45921 has 2020-048B - both are 2020-048 launch pieces. But S45916 has Piece designation 1998-067RP, and its parent is A09547\* with piece designation 2020-011, an apparent contradiction. In fact 2020-011 is the correct launch for both, with launch date 2020 Feb 15, but USSF assigns 1998-067 piece designations and a 1998 launch date for all objects released from the ISS. I added the asterisks to facilitate automatic checking: it lets you know to be careful about the launch date and launch information for this object.

The central body names are given in the Worlds file.

– **SDate**

Separation Date (or Phase Start Date).

This UTC date (in (See Vague Date ) format) is the start time for the current phase. In the simplest cases, it is the time when the object separated from its parent.

– **Primary**

(or Central Body).

The value of this field is a string representing the central body for the current phase. These strings are defined in the Worlds file. (Usually, the central body is Earth.)

– **DDate**

Descent Date (or Phase End Date).

This UTC date (in (See Vague Date ) format) is the end time for the current phase. In the simplest cases, it is the time when the object reentered the atmosphere. If blank, the phase is still in progress.

– **Status** This field gives the event that ends the current phase.

See the discussion on (See phases) in the definitions section.

– **Dest** (Destination) This field gives the destination of the current phase. This may be the reentry or landing location, the JCAT identifier for the new parent object that the object is now attached to, or the world name of the body whose gravitational sphere the object is now entering.

See the discussion on (See phases) in the definitions section.

- The next set of fields (Owner, State, Manufacturer, Bus, Motor) describe ownership and construction.

– **Owner** The (See OrgCode ) for the owner/operator of this object.

– **State** The (See OrgCode ) for the country/state associated with the owner/operator.

- 
- **Manufacturer** The (See OrgCode ) for the entity that built the object.
  - **Bus** This string gives the spacecraft bus (chassis) type. It isn't standardized, and many objects are one-off. It's most useful for things like commercial communications satellite where satellites of the same type are used by many different owners.
  - **Motor** The name of the main thruster or rocket engine in the object's propulsion system. Particular attention has been paid to determining the model of apogee motor or apogee thruster used on satellites, as this has not previously been well documented. The entries in this field have not been standardized but some information may be found in (See the Engines file.)
- The next set of fields (Mass, DryMass, TotMass, Length, Diameter, Span, Shape) describe the object's mass and dimensions.
    - **Mass, MassFlag** Mass of this GCAT object in kg, at launch (meaning, at initial orbital insertion), not including mass of attached objects.
 

If the MassFlag is '?' then the value is an estimate, hopefully good to about 20 percent.
    - **DryMass, DryFlag** Dry mass of this GCAT object (which is a reasonable proxy for the mass of the object after its active lifetime). Value is in kg. Does not include the mass of attached objects.
 

If the DryFlag is '?' then the value is an estimate, hopefully good to about 20 percent.
    - **TotMass, TotFlag** Total mass of this object at launch (orbital insertion), in kg, if nonzero. For a set of GCAT objects attached to each other the total mass will be given for one of them (usually the S catalog entry), and the others will have TotMass = 0. If you add up the Mass values for each of the objects, the result should be equal to the TotMass.
 

If the TotFlag is '?' then the value is an estimate, hopefully good to about 20 percent.
    - **Length, LFlag** Longest dimension of the main body of the object in metres.
 

If LFlag is '?' the value is a guess, hopefully good to about 20 percent.
    - **Diameter, DFlag**

The Diameter is the second longest dimension of the main body of the object in metres. Many objects are cylinders or square-sectioned cuboids, so I haven't bothered to give a separated depth and width. The length times the diameter is a reasonable approximation to the cross-section of the object not counting appendages.

If DFlag is '?' the value is a guess, hopefully good to about 20 percent.
    - **Span, SpanFlag**

The Span is the largest dimension in metres of the entire object across all appendages (booms, solar arrays, antennae). To avoid hitting the object you should stay outside a sphere of diameter equal to the Span.

If SpanFlag is '?' the value is a guess, hopefully good to about 20 percent.
    - **Shape** A string giving the approximate shape of the object. This is included really because it was in the old RAE table of Earth satellites. It isn't a substitute for a 3D CAD model though!
  - The following set of fields (ODate, Perigee, Apogee, Inc, OpOrbit, OQUAL) describe a 'canonical orbit'. The orbit of an object changes with time due to atmospheric drag and other perturbations, and in some cases it changes drastically due to active maneuvering. I pick one orbit (the 'canonical orbit') that is representative of the spacecraft's early operations, after initial positioning, to include in the catalog. But detailed analysis should consult detailed orbital data versus time for each object, from the Space-Track TLEs or other sources.
    - **ODate** Orbit Epoch Date. Epoch of canonical orbital data, Vague Date format.
    - **Perigee, PF** Conventional perigee height in km of canonical orbit. Equal to perigee radius minus equatorial radius of central body.
 

If PF is equal to '?' the value is a guess.

---

- **Apogee, AF**

Conventional apogee height in km of canonical orbit. Equal to apogee radius minus equatorial radius of central body.

If AF is equal to '?' the value is a guess.

- **Inc, IF**

Inclination of canonical orbit in degrees with respect to coordinate system equator. Heliocentric orbits are given with respect to the J2000 ecliptic. Earth orbits are given with respect to the equator of date (strictly, TEME equator). Orbits around other central bodies are given with respect to the IAU equator of that body.

If IF is equal to '?' the value is a guess.

- **OpOrbit**

Orbit type of the canonical orbit.

- **OQUAL**

Orbit Quality Note.

Source of the canonical orbit. Usually blank; it's a place for me to make a note to remind me where I got the orbit data from in special cases. 'J' means I estimated the orbit myself.

- The final field really belongs with the first set, with additional names for the object.

- **AltNames**

A comma-delimited list of further alternative names for the object.

## VIII.2.9 Payload Catalog Column Descriptions

- **JCAT** The JCAT identifier (letter followed by digits) identifies the object and ties this catalog to the object catalogs.
- **Piece** The Piece field contains the piece designation, usually the COSPAR 'international Designation'. It is the same as that given in the object catalog and is repeated here for human-readability and convenience.
- **Name** The name in the payload catalog is the name given in the UN satellite registry, where available. I usually fill in another name (usually Name or PLName from the object catalog) where not, for readability.

If the satellite is UN registered (a registration document is noted in the appropriate field) but no name was given in that registration, I enclose the name used in square parentheses to indicate that it's not official. For example, for object S01328, the UNReg field contains "A/AC.105/INF.107", indicating that the satellite is registered. The name is given as "[Explorer 27]", the square brackets indicating that no name was actually given in the registration document.

As with other UN registration metadata reproduced here, the UN name data are provided so you can compare UN registration information with the primary information in the catalog. In this instance, the name in the object catalog (or even better, in the unicode name list) is generally to be preferred over the name given here.

- **LDate** (Launch Date). Same as in object catalog, provided for convenience and cross checking.
- **TLast**

Last Known Active Time.

The date on which the satellite was most recently known (by me) to be active. Often, it's hard to find out whether a satellite is still operating, especially if it does not actively control its orbit. It is therefore helpful to know if it's been known to be active fairly recently, or whether there has been no news of it for decades. Caveat: I only update this infrequently and patchily. The fact that \*I\* haven't heard news of the satellite operating since 2006 doesn't mean that obvious evidence of its continued activity doesn't exist.

---

Vague Date Format is used to record the value.

An asterisk in this field indicates that no information is available.

- **TOP** End Operation Date.

The date on which the satellite is believed to have completed regular operations. This is a loosely defined concept. The idea is that after this date the satellite may have been used for on-orbit tests and training, or may still have had an active radio beacon, but was not in use for its primary purpose. (That's not the same as 'end of primary mission', which can be much earlier).

Vague Date Format is used to record the value.

An asterisk in this field indicates that the payload is believed to be still operating.

- **TDate** End of Transmission Date.

I also refer to this as the "Dead, Dead, Dead" date - it is the date after which the satellite became completely silent and unresponsive, or when no further contact was made by its owners. I prefer to use this as an end-of-life date. (There is some ambiguity here. Some old satellites are abandoned by their owners but still emit a radio beacon.)

Vague Date Format is used to record the value.

An asterisk in this field indicates that the payload is believed to be still transmitting.

- **TF**

End of life special flags. Flags here have the following meaning:

Value	Meaning
E	Deep space mission, may be operating outside Earth orbit.
U	This satellite is thought to be still working but the UCS active satellite list suggests it is not.
X	Satellite end of life date is a guess and satellite could still be partly operating.
Z	Zombie satellite: no longer controlled, but continues emitting a beacon signal.

These flags were added to the data to make automatic comparisons with the UCS active satellite list easier. (Easier for me, mostly.)

- **Program**

This field identifies groups of related satellites. I use it to drive the organization of mission logs which I am preparing for a future release.

- **Plane**

This (new) string-valued field can be used to label orbital planes or shells in a constellation. At the moment I am using numeric shell numbers to group OneWeb satellites.

- **Att**

Attitude control flag

The field describes the type of attitude control. However, values of this field have not yet been systematically filled in.

Value	Meaning
-	Unknown
G	Gravity gradient stabilized
P	Pointed, 3-axis stabilized
PS	Sun pointed
PN or N	Nadir (Earth) pointed
S	Spin stabilized
U	Unstabilized

---

- **Mvr**

Maneuverability Flag.

This field indicates whether the satellite has or had a propulsion system capable of changing its orbit. Valid nonempty values are 'M', indicating that the satellite is maneuverable, and 'D', indicating that the satellite's propulsion system is capable of a single burn to deorbit the satellite.

- **Class** The class is a one- or, rarely, two-letter character string used to classify satellites as military, commercial, etc. This is usually based on the status of the owner/operator organization, but with some exceptions (for example the Vostok spaceships are considered civil even though operated partly by the Soviet military). The four supported single-letter values are:

Value	Meaning
A	Amateur/academic/non-profit
B	Business (commercial)
C	Civil (government but not military)
D	Defense (govt. military, intelligence)

Two-letter combinations of these have the obvious meaning: e.g. BD means a satellite which has both commercial and military use. In general, I find the concept of 'dual-use' to be mostly unhelpful. Almost everything is potentially usable for military purposes, but almost everything is nevertheless fairly clearly assignable to one of the above four principal uses. I only use the dual-use two-letter characterization for 16 (as of 2020) satellites in the catalog where the management and operation is clearly shared between two organizations connected with different class values.

- **Category**

The category is a different classification, orthogonal to the class. It describes the general purpose of the satellite. A satellite may have one or two categories.

In the case where two values are present, the values in this field are concatenated with a slash between them - for example 'IMG/TECH'.

Uncertain categories have an appended question-mark.

An asterisk appended to the category indicates that the orbital data for the satellite are (or formerly were) kept secret by the US government.

The defined categories are:

Value	meaning
AST	Astronomy
BIO	Biology and life sciences
CAL	Calibration (for atmospheric density, space surveillance radars, etc). Usually passive.
COM	Communications
EDU	Educational purposes.
EOSCI	Earth observing science, except imaging
EW	Missile early warning, including ballistic missile defence tracking
GEOD	Geodesy
IMG	Imaging (optical), except meteorology
IMG-R	Imaging (radar)
INF	Infrastructure (support structures, deployers etc)
MET	Meteorology (imaging)
MET-RO	Meteorology (radio occultation)
MGRAV	Microgravity experiments
MISC	Miscellaneous (e.g. burial services)
NAV	Navigation, positioning and timing
PLAN	Deep space related mission
RB	Rocket body (rocket upper stage)
RV	Reentry vehicle
SCI	Scientific studies, except astronomy and Earth observing
SIG	Signals intelligence
SS	Spaceship, i.e human spaceflight related (including cargo ships)
TARG	Target for missile defense or antisatellite tests
TECH	Technology and training
WEAPON	Weapon, including antisatellite experiment and FOBS

- **Result**

The Result flag is a single letter used to identify satellites which failed early in their mission. Values of this flag are:

- S - success
- F - failed
- U - Unknown
- N - No test (e.g. rocket failed before satellite had a chance to operate).

- **Control**

Location of the spacecraft operations control center. I have not filled this field in systematically yet, it's really a 'future project' (maybe never). However those values which are filled in should be reliable.

- **Discipline**

For scientific satellites, this field may note one or more specific scientific areas in which the satellite is carrying out research. Values used to date are:

Value	Meaning
AIS	Automatic ID system (ship tracking)
ALT	Radar altimeter
ATM	Atmospheric science
AUR	Auroral research
BIO	Biology and life sciences
ENV	Space environmental exposure
ESCI	Earth sciences
F	Electromagnetic fields
GEOD	Geodesy
GRA	Gamma ray astronomy
IMG	Imaging
ION	Ionospheric research
IRA	Infrared astronomy
M	Humans in microgravity and related research
MG	Microgravity experiments
MM	Micrometeorite studies
OA	Optical astronomy
P	Particles
PHY	Basic physics
PL	Planetary science
RFA	Radio-frequency astronomy
SMA	Submillimeter astronomy
SOL	Solar physics
SX	Solar X-ray astronomy
TECH	Technology experiments
UVA	Ultraviolet astronomy
XNAV	X-ray navigation
XRA	X-ray astronomy

- **UNState**

If the satellite is registered with the UN, this field contains the OrgCode string corresponding to the country which registered it. If this country is not the owner country I have assigned the object to in the object catalog, an asterisk is appended to the OrgCode to alert you.

If the satellite has not been registered with the UN, the field contains, in square parentheses, the OrgCode string corresponding to the country which I think \*ought\* to have registered it. (If this isn't the same as the owner country in the object catalog, an asterisk is appended to the closing square parenthesis - e.g. '[US]\*').

If the satellite has not been registered, but it's not a 'real payload' (minor subsatellite, etc.) and I don't think it requires registration, the field is left blank.

- **UNReg**

The UNReg field gives the ID of the UN registration document in which the satellite was registered, if it was. These documents are usually in the ST/SG/SER.E series or the A/AC.105/INF series.

An appended asterisk indicates that the online UN site reports that the satellite was registered in a particular document, but the document isn't yet available on that site, so I can't see what it actually says! Unfortunately some US registrations have been 'in process' for several years now (as of mid 2020).

A blank entry indicates that the satellite has not been registered with the UN.

- **UNPeriod** is the nodal period in minutes reported in the UN registration document, if any. Although the UN registration orbital information, reported by the state of registry, is valuable for a variety of research purposes, it is not always reliable and I recommend that users prefer the orbital data in the main object catalog which is based on US and hobbyist tracking data.
- **UNPerigee** is the orbital perigee height in km reported in the UN registration document, if any.

- 
- **UNApogee** is the orbital apogee height in km reported in the UN registration document, if any.
  - **UNInc** is the orbital inclination in degrees reported in the UN registration document, if any.

- **DispEpoch**

Disposal Epoch. Only for maneuverable payloads in Earth orbit; the epoch of the disposal orbit given in the following fields. The disposal orbit information is used to assess compliance with disposal recommendations. For objects other than maneuverable payloads, the disposal orbit is deemed to be the initial orbit. For satellites still able to maneuver, a recent orbit may be given as a placeholder.

Inclusion of the disposal orbit data is currently an experiment and the data should not be relied upon at present (2024 Oct).

- **DispPeri**

Disposal perigee; perigee of the orbit at the end of life for a maneuverable satellite.

- **DispApo**

Disposal apogee; apogee of the orbit at the end of life for a maneuverable satellite.

- **DispInc**

Disposal inclination; inclination of the orbit at the end of life for a maneuverable satellite.

- **Comment** - A descriptive comment, which I may or may not have felt moved to fill in.

## Chapter VIII.3

# Main Object Catalogs

### VIII.3.1 Primary Orbital Object Catalogs

#### VIII.3.1.1 The Standard (S) Satellite Catalog

Since the late 1950s the US government has maintained a catalog of satellites (often referred to as the SATCAT). Each satellite is given a sequential number (1 was the rocket stage from the first Sputnik). These numbers are sometimes referred to as SSN numbers.

In GCAT, each entry in the S catalog (Standard Satellite Catalog or satcat) corresponds directly to the corresponding entry in the US catalog; entry S00001 corresponds to SSN 1, entry S40000 corresponds to SSN 40000. The S catalog contains additional metadata not present in the US catalog, described later in this chapter. Note that I will use SATCAT in upper case to refer to the US catalog, while the lower case version will always refer to GCAT's S catalog.

By convention I render entries 1-99999 in each catalog with 5 digits, in this case S00001 to S99999. I then jump to 9 digits for objects 000100000 onwards (S000100000 in this case). I am optimistic that we won't reach S999999999 before I retire, so that'll be Somebody Else's Problem.

There are, as always, complications. Not infrequently, the SSN numbers associated with two space objects are swapped, or an SSN number is reassigned to a different object and the previously assigned object is now not in the catalog. However, archival TLE (Two Line Element) sets for the previous object remain associated with the same catalog number, potentially causing confusion. Although I would rather not reassign numbers, in the interests of practical compatibility the S catalog entry corresponds to the object MOST RECENTLY ASSOCIATED with that catalog number (and the GCAT is updated as required to reflect this).

The SSN number is really associated with an object tracked by the US space tracking team (currently the 18th Space Control Squadron and associated organizations). The set of TLEs associated with that catalog number, for the most part, define the SSN. The association of that catalog number with a physical object (satellite, rocket, debris) is an inference. Sometimes I disagree with the association made, and the S catalog reflects that. The harder problem is when you have, say, 3 SSN tracked objects and three known payloads, but you have no idea which is which. This can occur, for example, when three externally similar cubesats deployed from the same vehicle immediately fail, so even the satellite owners don't know which is which. In this case the SATCAT will just have them as 'OBJECT C', etc., and not attempt to make an identification. I prefer to make an arbitrary assignment of the three objects to catalog numbers but flag the assignments as uncertain. This lets me enter all the metadata such as country, owner, name etc. and so statistical counts such as number of payloads associated with a given country will come out right.

Some satellites are made up of several attached sections. When I deem that these separate sections are of sufficient interest to deserve their own catalog entry (for example because their metadata are interestingly different) I create additional entries in the auxcat (see below), and choose one of the sections to be associated with the S entry. As an example, for CORONA satellites both the CORONA payload and the attached Agena rocket stage, as well as

---

any Agena aft rack attached payloads, get catalog entries. In such cases the S entry is given to the payload; metadata includes the information that the CORONA and the Agena remained attached until reentry.

The SATCAT associates debris objects with a particular launch but does not identify them in detail; again, I make my best guess as to the nature and origin of particular debris objects.

The US catalog is coy about certain military and intelligence satellites belonging to the US and its allies. Usually a cover name (e.g. USA 304) and a launch date are provided, but no orbital data or reentry date. Since I do not have access to secret information, I am free to speculate. Usually it's not very hard and identifications of secret satellites with particular programs and orbits mostly have a high degree of confidence.

### **VIII.3.1.2 The Auxiliary (A) Satellite Catalog.**

The auxcat contains entries for objects not in the standard catalog. The catalog numbers have the prefix 'A', so the first entry is A00001.

Objects end up in the A catalog for a variety of reasons:

- Object should have been in S catalog but was omitted (not tracked, or administrative oversight)
- Object is attached to another object (see discussion in S catalog section) Some special cases include Shuttle payload bay cargo items, external ISS components, and internal ISS cargo entries used for mass accounting.
- Object was in orbit, with perigee well above the atmosphere, but was deorbited after less than a full orbit.
- Object had positive perigee but reentered on first object.
- Object had mildly negative perigee. This includes some rocket stages (e.g. Ariane core stages) and some objects released during reentry of spacecraft (discarded service modules, parts of film recovery capsules). I like to perturb the boundaries of definitions and see what falls in. These objects don't strictly count as satellites by my rules, but they are 'close enough' to be interesting.
- Objects with greater total energy per unit mass than a low orbit satellite. This includes some high apogee (above 10,000 km) suborbital flights and some high velocity reentry tests.

Sometimes objects already in the A catalog get a US SATCAT number - for example, external ISS experiments which are unexpectedly discarded into orbit at the end of their lives. In this case the object is moved to the S catalog, and its A catalog number is retired. In previous internal use of the catalog I've reused such freed A catalog entries, but with the formal release of GCAT it is my intent that any such reassignments will be recorded formally and the empty catalog entries will not be reused.

When it is clear that an object is likely to receive a SATCAT number in the near future, it is placed in the T catalog (see below) instead of the A catalog.

### **VIII.3.1.3 The Failure To Orbit (F) Satellite Catalog**

The ftocat (F, Failure to orbit catalog) contains objects from failed launches which were expected to have had satellite catalog entries if the launch had been successful. The objects are upper stages and payloads from launches with 'F' launch designations (e.g. 1959-F01).

Note that objects from 'U' marginal-orbit launches (1959-U01 etc) are in the auxcat rather than the ftocat. Objects from pad explosions ('E' launches where no actual launch occurred) are in the lcat.

I have gone to some trouble to estimate the best-guess suborbital perigee, apogee and inclination for the objects in the F catalog. If you have better data for a particular launch, please let me know.

---

## VIII.3.2 Supporting Catalogs

The two supporting catalogs are relatively less complete and are of variable data quality, as described below. *Caveat emptor - maxime quando sine sumptu est!*

### VIII.3.2.1 The Rocket (R) and Suborbital Object Catalog

The rcat contains objects whose apogee was probably above 80 km but which did not reach orbit (i.e. are not included in the orbital catalogs). The main purpose of the rcat is to record suborbital stages of orbit launch vehicles, allowing me to specify the detailed configuration of that particular flight vehicle - it gives me a place to put the type and serial number of the stages. Other metadata - mass, size, (sub)orbital parameters - are sometimes included but typically with approximate or guessed values. Orbital inclination values of zero should be ignored.

Object associated with suborbital launches are also included. The catalog is not complete in this respect and the caveats on the quality of the metadata for such objects apply even more strongly. But it gives me a place to store parameters of sounding rocket and missile payloads when I know them.

### VIII.3.2.2 The Low-altitude (L) Endoatmospheric Object Catalog

The lcat contains objects whose apogee was probably below 80 km. Like the rcat, the main purpose of the lcat is to record the stage configuration of orbital launches, serving as a place to store the details of lower stages (first stage, strap-on boosters, etc) that did not leave the atmosphere. As for the rcat, but even more so, metadata on mass, size and trajectory are approximate or guessed and should usually be treated with skepticism. (For a few cases, such as Apollo-Saturn lower stages, the data are accurate.)

Mostly the lcat is used to store low altitude objects associated with a launch which also had exoatmospheric parts. However, some objects associated with purely endoatmospheric and mesospheric launches are included. Nevertheless, the presence of a low altitude launch in the launch lists does not guarantee its associated objects will exist in the lcat.

As noted above under ftoicat, objects from launches which exploded on the pad are also included in the lcat.

## VIII.3.3 Temporary Catalogs

Unlike the main catalogs, the catalog numbers in the T and C catalogs are not assigned sequentially. Currently the first object in the C catalog is C00100.

The tmpcat contains objects which are (1) in orbit, and (2) do not have US satellite catalog numbers but are expected to get them in the fairly near future. This usually means objects which are aboard the ISS or a cargo ship and slated for later deployment, such as cubesats to be ejected from the Kibo module; or subsatellites to be ejected from another satellite; or objects such as the Crew Dragon Trunk which is left in orbit at the end of a Crew Dragon mission. Starlink and other megaconstellation satellites may also receive T numbers based on the 70000-series numbers used by Celestrak Supplemental TLEs before identifications are made with the SATCAT numbers.

When the T catalog object does get a US SATCAT number, its GCAT identifier is changed. The object is added to the S catalog, and its T catalog number is removed (and later reassigned). Users should therefore beware of referring to T catalog numbers - they are ephemeral and their reassignment is not formally recorded. They are a compromise, allowing the instantaneous catalog to reflect the state of things as well as possible, while avoiding reassigning any 'permanent' catalog entries.

Objects which may never get catalog numbers - such as known objects which nevertheless have not been tracked - are instead put in the auxcat as described above.

---

### VIII.3.3.1 The Complementary Space Object (C) Catalog

The csocat (C catalog) is a rather different construct. The objects here are those detected and observed by someone other than the US space tracking network, and not immediately identified with an existing SATCAT entry. These include objects found by hobbyist observers, astronomers, and non-US satellite tracking groups. ‘Analyst objects’ from the US space tracking network are also included.

(I will admit that the ‘C’ originally stood for Canadian Space Society, the initial source of hobbyist TLEs in the 1990s thanks to Ted Molczan).

Since the objects in the C catalog may or may not be also present in the S catalog, I do not include C catalog objects in my statistical summaries (of numbers of satellites launched, etc.).

C catalog entries are initially assigned the value NNA (No Number Assigned) in the Satcat number field (see column descriptions). Then, when and if a C catalog object is later identified with an S catalog entry, the actual SATCAT number is placed in the field to flag that the object is no longer ‘unaffiliated’. The user may therefore ignore all C catalog entries whose Satcat number is not ‘NNA’.

Types of objects in the C catalog include (with catalog number ranges used as of mid-2020, but not guaranteed to be rigidly adhered to):

- (C00100-C00399) Objects found by Near-Earth asteroid astronomers and cataloged by Bill Gray (project-pluto.org) PThese include distant space junk but also some natural asteroids.
- (C10000-C29999) Objects found by the ISON and Vimpel networks in Russia
- (C70000-C79999, C90000-C99999) Objects found by hobbyist observers (satobs.org) and cataloged by Ted Molczan, Mike McCants and colleagues.
- (C80000-C89999) ‘Analyst objects’ from Space-Track.org given temporary satellite catalog numbers. The entry in the C catalog has the same catalog number as assigned by Space-Track, but with the C prefix. These numbers generally are between 80000 and 90000 (although some have occurred in the 70000s.)

Since the objects in the C catalog are often of unknown origin, the launch dates and international designations in the catalog are meaningless and should be ignored. The orbital metadata, however, are based on actual data.

### VIII.3.4 Event Catalogs

The event catalogs consist of the main Event Catalog, for Earth orbiting objects, and the deep space catalogs which are only briefly discussed here.

#### VIII.3.4.1 The Event Catalog

The SATCAT data model is basically that launches put a set of objects in orbit at a given date (launch date), some of which eventually (decay date) reenter. The structure of the main GCAT object catalogs adds the idea that objects associated with a launch don’t all appear on the launch date, but may instead separate from one of the other objects at a later (sep date) time. This model covers the vast majority of objects in the catalog, but some have more complex histories. The Event Catalog (ecat) is an attempt to accommodate those more complex histories.

We introduce the idea that each object in GCAT has a history composed of multiple ‘phases’. A new phase typically begins with either separation from a parent or attachment to a new parent. Parents may be GCAT objects or GCAT bodies (worlds). Another kind of phase is less physical: the object changes critical metadata - either its name or its owner. For a typical object, there is only one phase, which begins with separation from the parent object and ends with reentry - or is still in progress. But for some objects there are many phases involving renaming, on-orbit resale, docking and undocking, some other form of attachment to another object (e.g. EVA assembly), bringing inside or outside a space station, entering deep space, entering or leaving the gravitational sphere of influence of a

---

new central body, landing or taking off from such a body, or returning to the Earth-Moon system. Each such phase can be characterized by:

- - A parent (GCAT object or body)
- - Phase start time
- - Phase end time
- - Event that ends the phase
- - New parent or destination at phase end

All of this information is conveniently represented in a record identical to the normal satellite catalog entries. Thus, objects with multiple phases are represented by multiple entries with the same catalog identifier; each entry represents a phase. So that this complexity can be ignored when not useful, the main object catalogs contain only a single entry for each object, the first phase. Second and subsequent phases are stored in the *ecat*. The *ecat* records are in chronological order, although this is mainly for my convenience. Thus for example GCAT object A07959 has five phases, leading to one entry in *auxcat* and four entries in *ecat*.

The details of phases are captured in the phase-ending event type, which is stored in the 'status' field of each phase record. The various options are defined in detail in the status column description.

### VIII.3.4.2 The Deep Space Catalog

Objects which pass the EL1:4 deep space boundary at about 150,000 km from Earth are given a 'D' catalog designation in addition to their entries in the S or A catalogs. The S or A catalog uses the decay date, status and destination fields to record the object's transition to deep space and its new catalog number. The corresponding DeepCat entry records the object's arrival in deep space and its departure to its next phase - reentry, entry to the lunar sphere of influence, or departure from the Earth-Moon system. The Heliocentric Register and the Lunar and Planetary Register then record subsequent phases of the object as it visits different bodies in the solar system, using its D catalog designation.

I recognize that the reassignment of a new catalog number to an object once it leaves Earth orbit may be inconvenient. A crossindex between D designations and S/A designations is provided at ([See https://planet4589.org/space/gcat/data/cat/deepindex.html](https://planet4589.org/space/gcat/data/cat/deepindex.html))

The research behind the separate release of the Deep Space Catalog is discussed more fully at <https://planet4589.org/space/deepcat> (<https://planet4589.org/space/deepcat>). While I consider it a part of the General Catalog of Artificial Space Objects, it is a relatively self contained subset and is documented and published on an independent release schedule. The *deepcat* files within GCAT are kept more up to date.

### VIII.3.5 Payload Catalogs

A lot of the metadata I track for satellite payloads (end of operation date, payload category, UN registration information, etc.) is not relevant for debris objects. To save space in the main catalogs, I pull out this extra information into separate 'payload catalogs'. Each object from the main catalogs has zero or one record in the corresponding payload catalog.

For example, GCAT object A00489 appears in the main catalog 'auxcat'. It also has a record in the corresponding payload catalog 'pauxcat' with the additional payload metadata. The payload catalogs have the same name as the corresponding main catalog, except with a leading 'p', so it's pretty easy.

The payload catalogs are *psatcat*, *pauxcat*, *pftocat* and *ptmpcat*. In addition there is a *plcat* corresponding to the *lcat*, containing limited payload info for a few payloads for launches which exploded on the pad and so didn't make it into *ftocat*, and similarly *precat* and *pdeepcat* for some special cases in *rcat* and *deepcat*.

---

Of greatest interest is probably the end-of-life date information in psatcat, since a comprehensive satellite operational lifetime dataset has never before been published. The psatcat also is useful for statistical analyses since it characterizes satellites as nonprofit, commercial, civil or defense, and as communications, imaging, navigation, science, etc.

### VIII.3.6 Unicode list

The usatcat file contains a list of satellite names in unicode with the corresponding GCAT catalog numbers. Only objects whose name is not in the Latin alphabet are included. This data should really just be an additional column in the payload or object catalogs but some of my older data entry software isn't completely smooth in the way it handles unicode, so it was easier for me to keep the unicode data separately in a dedicated file.

The file is a simple text file with two columns, the GCAT catalog identifier and the unicode satellite name. It is in alphabetical order of GCAT identifier, so auxcat entries precede satcat ones.

### VIII.3.7 Derived Catalogs

#### VIII.3.7.1 Current Catalog

The currentcat file is provided as a useful subset of GCAT. It is largely derived from the information in satcat, auxcat and ecat. There is one record for each entry in satcat and auxcat; it is the **most recent** phase for each object. In the main GCAT, if you want to know the current state of an object in satcat, you also have to check through all its records in ecat to find the final one. I decided this is such a common use case that I'd do the work for you and make a 'most recent phase' catalog.

The catalog contains a subset of the fields in satcat, and a couple of new fields: the **Active flag** which is 'A' if the object is a currently active payload, and the first character of SatType (i.e. P for payload, R for rocket, C for component or D for debris) otherwise. and the **extended status** field which decodes the Status field information into a more readable text field.

Space probes have two catalog IDs, the regular JCAT for their near-earth launch phase and a Deep Space Catalog ID beginning with 'D'. The currentcat has a DeepCat column which gives the 'D' identifier for the object if one exists, corresponding to the object's JCAT field in the deepcat file.

There is one set of data not in the other catalogs: for objects currently in Earth orbit, the most recent available orbital data are provided in currentcat rather than the 'canonical' early orbit data provided in, e.g., satcat.

#### VIII.3.7.2 Launchlog File

The LaunchLog file is a list of all orbital launch attempts in chronological order. The data are extracted from the launch lists and the payload catalogs. It joins the launch and payload information to have one line per orbital payload with the payload name and the launch information. It replaces and supersedes the earlier launchlog.txt file on my site.

### VIII.3.8 Object Catalog Column Descriptions

- The first few fields (JCAT, Satcat, Piece, Type, Name, PLName, LaunchDate) identify the object and name it.

---

– **JCAT**

The General Catalog (GCAT) uses an alphanumeric identifier (JCAT, originally Jonathan’s Catalog ID) to uniquely tag space objects. The identifier consists of a single prefix letter followed by a sequence number with either 5 or 9 digits (examples: A00022; S101234009). The 9 digit case is not yet in use, but is supported in anticipation of the introduction of 9-digit SATCAT numbers by the US DoD.

The leading letter tells you which object catalog the object belongs to, as follows:

JCAT letter	Catalog
A	auxcat (Auxiliary catalog)
C	csocat (Complementary catalog)
D	deepcat (Deep space catalog)
F	focat (Failed to orbit catalog)
L	lcat (low altitude catalog)
R	rcat (suborbital catalog)
S	stdcat (Standard catalog)
T	tmpcat (Temporary catalog)

Note that there are no prefix letters associated with the ecat (event catalog), or the heliocentric and lunar-planetary registers, since they contain only objects already defined in the other catalogs.

Sequence numbers in the A, D, F, L, R, and S catalogs are assigned sequentially starting with 00001. However, occasional numbers may be missing due to deletions of spurious or reassigned entries.

Sequence numbers in the C and T catalogs are not assigned sequentially.

Sequence numbers in the S catalog are in one-to-one correspondence with the US SATCAT catalog numbers. Thus, S46112 corresponds to SATCAT satellite 46112 (2020-056A).

In exceptional cases, future releases of GCAT may reassign existing catalog numbers. Any such reassignments will be recorded explicitly in an accompanying table. However, users who have found earlier (pre-GCAT) JCAT catalog numbers that crept into my public files have no such guarantee - in particular, auxcat numbers previously seen in public files may now refer to different objects.

– **Satcat**

For objects in the US Satcat, this field contains an integer value which is the US SATCAT number. In the S catalog, this will be the same as the JCAT sequence number.

However, one US SATCAT number can correspond to multiple GCAT objects which are attached to one another. For example, SATCAT number 00032 corresponds to GCAT objects S00032 (Discoverer 11 payload), A00046 (Agena 1055 rocket stage), and A00047 (TOD experiment attached to Agena stage). All these objects have 00032 in the Satcat field.

Objects which do NOT have US SATCAT entries instead have a string in this field explaining why they don’t.

Value	Meaning
NNA	No (satcat) Number Assigned. Object should be in SATCAT but is not.
NNA A	No SATCAT number because remained attached to parent object
NNA C	No SATCAT number, component of complex object such as space station
NNA E	No SATCAT number because is an EVA spacesuit. These do not get recorded in SATCAT.
NNA I	No SATCAT number because object remained inside parent object
NNA P	No SATCAT number because completed less than one full orbit
NNA R	No SATCAT number because separated into marginally suborbital trajectory during parent reentry.
NNA S	No SATCAT number because launched into marginally suborbital trajectory
NNA T	Not in SATCAT because object was a separate object in orbit transiently, for only a few seconds (e.g. CORONA film capsule)
NNA X	Not in SATCAT because launch is a marginal orbit case
NSO	No SATCAT number because suborbital

- **Piece** The piece designation for the object. For objects in the US SATCAT this is the COSPAR (International) designation (e.g. 2020-032A). See the section on launch and piece designations in ‘definitions and conventions’ for details.

- **Type**

This field contains a SatType string as defined in the (See SatType section.)

This field tells you something about what kind of object this is. At the coarsest level, we characterize the object as payload (P), rocket stage (R), component (C) or debris (D). A component is a functional part of the spacecraft or rocket that is deliberately or accidentally ejected - a fairing, for example. A debris object in this sense is a fragment from a satellite breakup, usually accidental - although fragments from deliberate explosions or collisions are included in this category.

At a finer level the type string provides a lot more information for special cases. See the (See SatType definition) for more details.

- **Name** My recommended name for the object. The name is based on that used by the owner/operator of the object. In cases where the original name is in a non-Latin character set, see the associated (See GCAT unicode name list ) for a representation of the name in Unicode.

‘X part’ indicates that the object is an unidentified component that separated from X. ‘deb X’ indicates the object is a debris object from the breakup of X.

- **PLName**

The PLName (Payload Name) is an alternative name for the object. When available, it is the name used prior to launch by the manufacturer.

Some debris objects have a string with RCS followed by a number in the PLName field. This refers to the radar cross section in square metres. The RCS values obtained from early 2000s era SATCAT releases are unreliable, but may indicate which objects are particularly small or large.

Some objects have a PLName beginning with the string ‘[UNID]’. These objects are marked with an asterisk in the US SATCAT. They are unidentified debris objects; their piece designations (international designations) are believed to associate them with the wrong launch. For example, there are a lot of small component debris objects associated with Soviet Strela-2M communications satellites in rather similar

---

orbits. When such an object is discovered years after its launch, the effects of drag and perturbations are such that while it is obvious from the orbit that the object comes from a Strela-2M, there's no way to tell exactly which Strela-2M it is from.

– **LDate** (Launch Date).

The launch date is given in UTC, with 1 day precision. More accurate launch times are given in the launch lists. Usually you can map the object to a launch using the international designation, but see the discussion in the Parent field below for exceptions.

- The next set of fields (Parent, SDate, Primary, DDate, Status, Dest) describe the current 'phase' of the object.

– **Parent** The Parent field can be either

- \* the 'parent object' which the object is attached to at the start of the phase, or
- \* the central body whose gravitational sphere the object is leaving at the start of the phase.

The parent object is an (See Extended JCAT Identifier) - it's usually just a JCAT ID but sometimes there's a port location appended to make it more specific.

Also, in some cases an asterisk is appended to the identifier. This is a flag that the launch designation in the Piece field is not what you'd expect from the launch designation of the parent. In the normal situation, for example, S45920 has Piece designation 2020-048A, and its parent S45921 has 2020-048B - both are 2020-048 launch pieces. But S45916 has Piece designation 1998-067RP, and its parent is A09547\* with piece designation 2020-011, an apparent contradiction. In fact 2020-011 is the correct launch for both, with launch date 2020 Feb 15, but USSF assigns 1998-067 piece designations and a 1998 launch date for all objects released from the ISS. I added the asterisks to facilitate automatic checking: it lets you know to be careful about the launch date and launch information for this object.

The central body names are given in the Worlds file.

– **SDate**

Separation Date (or Phase Start Date).

This UTC date (in (See Vague Date ) format) is the start time for the current phase. In the simplest cases, it is the time when the object separated from its parent.

– **Primary**

(or Central Body).

The value of this field is a string representing the central body for the current phase. These strings are defined in the Worlds file. (Usually, the central body is Earth.)

– **DDate**

Descent Date (or Phase End Date).

This UTC date (in (See Vague Date ) format) is the end time for the current phase. In the simplest cases, it is the time when the object reentered the atmosphere. If blank, the phase is still in progress.

– **Status** This field gives the event that ends the current phase.

See the discussion on (See phases) in the definitions section.

– **Dest** (Destination) This field gives the destination of the current phase. This may be the reentry or landing location, the JCAT identifier for the new parent object that the object is now attached to, or the world name of the body whose gravitational sphere the object is now entering.

See the discussion on (See phases) in the definitions section.

- The next set of fields (Owner, State, Manufacturer, Bus, Motor) describe ownership and construction.

– **Owner** The (See OrgCode ) for the owner/operator of this object.

– **State** The (See OrgCode ) for the country/state associated with the owner/operator.

- 
- **Manufacturer** The (See OrgCode ) for the entity that built the object.
  - **Bus** This string gives the spacecraft bus (chassis) type. It isn't standardized, and many objects are one-off. It's most useful for things like commercial communications satellite where satellites of the same type are used by many different owners.
  - **Motor** The name of the main thruster or rocket engine in the object's propulsion system. Particular attention has been paid to determining the model of apogee motor or apogee thruster used on satellites, as this has not previously been well documented. The entries in this field have not been standardized but some information may be found in (See the Engines file.)
- The next set of fields (Mass, DryMass, TotMass, Length, Diameter, Span, Shape) describe the object's mass and dimensions.
    - **Mass, MassFlag** Mass of this GCAT object in kg, at launch (meaning, at initial orbital insertion), not including mass of attached objects.
 

If the MassFlag is '?' then the value is an estimate, hopefully good to about 20 percent.
    - **DryMass, DryFlag** Dry mass of this GCAT object (which is a reasonable proxy for the mass of the object after its active lifetime). Value is in kg. Does not include the mass of attached objects.
 

If the DryFlag is '?' then the value is an estimate, hopefully good to about 20 percent.
    - **TotMass, TotFlag** Total mass of this object at launch (orbital insertion), in kg, if nonzero. For a set of GCAT objects attached to each other the total mass will be given for one of them (usually the S catalog entry), and the others will have TotMass = 0. If you add up the Mass values for each of the objects, the result should be equal to the TotMass.
 

If the TotFlag is '?' then the value is an estimate, hopefully good to about 20 percent.
    - **Length, LFlag** Longest dimension of the main body of the object in metres.
 

If LFlag is '?' the value is a guess, hopefully good to about 20 percent.
    - **Diameter, DFlag**

The Diameter is the second longest dimension of the main body of the object in metres. Many objects are cylinders or square-sectioned cuboids, so I haven't bothered to give a separated depth and width. The length times the diameter is a reasonable approximation to the cross-section of the object not counting appendages.

If DFlag is '?' the value is a guess, hopefully good to about 20 percent.
    - **Span, SpanFlag**

The Span is the largest dimension in metres of the entire object across all appendages (booms, solar arrays, antennae). To avoid hitting the object you should stay outside a sphere of diameter equal to the Span.

If SpanFlag is '?' the value is a guess, hopefully good to about 20 percent.
    - **Shape** A string giving the approximate shape of the object. This is included really because it was in the old RAE table of Earth satellites. It isn't a substitute for a 3D CAD model though!
  - The following set of fields (ODate, Perigee, Apogee, Inc, OpOrbit, OQUAL) describe a 'canonical orbit'. The orbit of an object changes with time due to atmospheric drag and other perturbations, and in some cases it changes drastically due to active maneuvering. I pick one orbit (the 'canonical orbit') that is representative of the spacecraft's early operations, after initial positioning, to include in the catalog. But detailed analysis should consult detailed orbital data versus time for each object, from the Space-Track TLEs or other sources.
    - **ODate** Orbit Epoch Date. Epoch of canonical orbital data, Vague Date format.
    - **Perigee, PF** Conventional perigee height in km of canonical orbit. Equal to perigee radius minus equatorial radius of central body.
 

If PF is equal to '?' the value is a guess.

---

- **Apogee, AF**

Conventional apogee height in km of canonical orbit. Equal to apogee radius minus equatorial radius of central body.

If AF is equal to '?' the value is a guess.

- **Inc, IF**

Inclination of canonical orbit in degrees with respect to coordinate system equator. Heliocentric orbits are given with respect to the J2000 ecliptic. Earth orbits are given with respect to the equator of date (strictly, TEME equator). Orbits around other central bodies are given with respect to the IAU equator of that body.

If IF is equal to '?' the value is a guess.

- **OpOrbit**

Orbit type of the canonical orbit.

- **OQUAL**

Orbit Quality Note.

Source of the canonical orbit. Usually blank; it's a place for me to make a note to remind me where I got the orbit data from in special cases. 'J' means I estimated the orbit myself.

- The final field really belongs with the first set, with additional names for the object.

- **AltNames**

A comma-delimited list of further alternative names for the object.

### VIII.3.9 Payload Catalog Column Descriptions

- **JCAT** The JCAT identifier (letter followed by digits) identifies the object and ties this catalog to the object catalogs.
- **Piece** The Piece field contains the piece designation, usually the COSPAR 'international Designation'. It is the same as that given in the object catalog and is repeated here for human-readability and convenience.
- **Name** The name in the payload catalog is the name given in the UN satellite registry, where available. I usually fill in another name (usually Name or PLName from the object catalog) where not, for readability.

If the satellite is UN registered (a registration document is noted in the appropriate field) but no name was given in that registration, I enclose the name used in square parentheses to indicate that it's not official. For example, for object S01328, the UNReg field contains "A/AC.105/INF.107", indicating that the satellite is registered. The name is given as "[Explorer 27]", the square brackets indicating that no name was actually given in the registration document.

As with other UN registration metadata reproduced here, the UN name data are provided so you can compare UN registration information with the primary information in the catalog. In this instance, the name in the object catalog (or even better, in the unicode name list) is generally to be preferred over the name given here.

- **LDate** (Launch Date). Same as in object catalog, provided for convenience and cross checking.
- **TLast**

Last Known Active Time.

The date on which the satellite was most recently known (by me) to be active. Often, it's hard to find out whether a satellite is still operating, especially if it does not actively control its orbit. It is therefore helpful to know if it's been known to be active fairly recently, or whether there has been no news of it for decades. Caveat: I only update this infrequently and patchily. The fact that \*I\* haven't heard news of the satellite operating since 2006 doesn't mean that obvious evidence of its continued activity doesn't exist.

---

Vague Date Format is used to record the value.

An asterisk in this field indicates that no information is available.

- **TOP** End Operation Date.

The date on which the satellite is believed to have completed regular operations. This is a loosely defined concept. The idea is that after this date the satellite may have been used for on-orbit tests and training, or may still have had an active radio beacon, but was not in use for its primary purpose. (That's not the same as 'end of primary mission', which can be much earlier).

Vague Date Format is used to record the value.

An asterisk in this field indicates that the payload is believed to be still operating.

- **TDate** End of Transmission Date.

I also refer to this as the "Dead, Dead, Dead" date - it is the date after which the satellite became completely silent and unresponsive, or when no further contact was made by its owners. I prefer to use this as an end-of-life date. (There is some ambiguity here. Some old satellites are abandoned by their owners but still emit a radio beacon.)

Vague Date Format is used to record the value.

An asterisk in this field indicates that the payload is believed to be still transmitting.

- **TF**

End of life special flags. Flags here have the following meaning:

Value	Meaning
E	Deep space mission, may be operating outside Earth orbit.
U	This satellite is thought to be still working but the UCS active satellite list suggests it is not.
X	Satellite end of life date is a guess and satellite could still be partly operating.
Z	Zombie satellite: no longer controlled, but continues emitting a beacon signal.

These flags were added to the data to make automatic comparisons with the UCS active satellite list easier. (Easier for me, mostly.)

- **Program**

This field identifies groups of related satellites. I use it to drive the organization of mission logs which I am preparing for a future release.

- **Plane**

This (new) string-valued field can be used to label orbital planes or shells in a constellation. At the moment I am using numeric shell numbers to group OneWeb satellites.

- **Att**

Attitude control flag

The field describes the type of attitude control. However, values of this field have not yet been systematically filled in.

Value	Meaning
-	Unknown
G	Gravity gradient stabilized
P	Pointed, 3-axis stabilized
PS	Sun pointed
PN or N	Nadir (Earth) pointed
S	Spin stabilized
U	Unstabilized

---

- **Mvr**

Maneuverability Flag.

This field indicates whether the satellite has or had a propulsion system capable of changing its orbit. Valid nonempty values are 'M', indicating that the satellite is maneuverable, and 'D', indicating that the satellite's propulsion system is capable of a single burn to deorbit the satellite.

- **Class** The class is a one- or, rarely, two-letter character string used to classify satellites as military, commercial, etc. This is usually based on the status of the owner/operator organization, but with some exceptions (for example the Vostok spaceships are considered civil even though operated partly by the Soviet military). The four supported single-letter values are:

Value	Meaning
A	Amateur/academic/non-profit
B	Business (commercial)
C	Civil (government but not military)
D	Defense (govt. military, intelligence)

Two-letter combinations of these have the obvious meaning: e.g. BD means a satellite which has both commercial and military use. In general, I find the concept of 'dual-use' to be mostly unhelpful. Almost everything is potentially usable for military purposes, but almost everything is nevertheless fairly clearly assignable to one of the above four principal uses. I only use the dual-use two-letter characterization for 16 (as of 2020) satellites in the catalog where the management and operation is clearly shared between two organizations connected with different class values.

- **Category**

The category is a different classification, orthogonal to the class. It describes the general purpose of the satellite. A satellite may have one or two categories.

In the case where two values are present, the values in this field are concatenated with a slash between them - for example 'IMG/TECH'.

Uncertain categories have an appended question-mark.

An asterisk appended to the category indicates that the orbital data for the satellite are (or formerly were) kept secret by the US government.

The defined categories are:

Value	meaning
AST	Astronomy
BIO	Biology and life sciences
CAL	Calibration (for atmospheric density, space surveillance radars, etc). Usually passive.
COM	Communications
EDU	Educational purposes.
EOSCI	Earth observing science, except imaging
EW	Missile early warning, including ballistic missile defence tracking
GEOD	Geodesy
IMG	Imaging (optical), except meteorology
IMG-R	Imaging (radar)
INF	Infrastructure (support structures, deployers etc)
MET	Meteorology (imaging)
MET-RO	Meteorology (radio occultation)
MGRAV	Microgravity experiments
MISC	Miscellaneous (e.g. burial services)
NAV	Navigation, positioning and timing
PLAN	Deep space related mission
RB	Rocket body (rocket upper stage)
RV	Reentry vehicle
SCI	Scientific studies, except astronomy and Earth observing
SIG	Signals intelligence
SS	Spaceship, i.e human spaceflight related (including cargo ships)
TARG	Target for missile defense or antisatellite tests
TECH	Technology and training
WEAPON	Weapon, including antisatellite experiment and FOBS

- **Result**

The Result flag is a single letter used to identify satellites which failed early in their mission. Values of this flag are:

- S - success
- F - failed
- U - Unknown
- N - No test (e.g. rocket failed before satellite had a chance to operate).

- **Control**

Location of the spacecraft operations control center. I have not filled this field in systematically yet, it's really a 'future project' (maybe never). However those values which are filled in should be reliable.

- **Discipline**

For scientific satellites, this field may note one or more specific scientific areas in which the satellite is carrying out research. Values used to date are:

Value	Meaning
AIS	Automatic ID system (ship tracking)
ALT	Radar altimeter
ATM	Atmospheric science
AUR	Auroral research
BIO	Biology and life sciences
ENV	Space environmental exposure
ESCI	Earth sciences
F	Electromagnetic fields
GEOD	Geodesy
GRA	Gamma ray astronomy
IMG	Imaging
ION	Ionospheric research
IRA	Infrared astronomy
M	Humans in microgravity and related research
MG	Microgravity experiments
MM	Micrometeorite studies
OA	Optical astronomy
P	Particles
PHY	Basic physics
PL	Planetary science
RFA	Radio-frequency astronomy
SMA	Submillimeter astronomy
SOL	Solar physics
SX	Solar X-ray astronomy
TECH	Technology experiments
UVA	Ultraviolet astronomy
XNAV	X-ray navigation
XRA	X-ray astronomy

- **UNState**

If the satellite is registered with the UN, this field contains the OrgCode string corresponding to the country which registered it. If this country is not the owner country I have assigned the object to in the object catalog, an asterisk is appended to the OrgCode to alert you.

If the satellite has not been registered with the UN, the field contains, in square parentheses, the OrgCode string corresponding to the country which I think \*ought\* to have registered it. (If this isn't the same as the owner country in the object catalog, an asterisk is appended to the closing square parenthesis - e.g. '[US]\*').

If the satellite has not been registered, but it's not a 'real payload' (minor subsatellite, etc.) and I don't think it requires registration, the field is left blank.

- **UNReg**

The UNReg field gives the ID of the UN registration document in which the satellite was registered, if it was. These documents are usually in the ST/SG/SER.E series or the A/AC.105/INF series.

An appended asterisk indicates that the online UN site reports that the satellite was registered in a particular document, but the document isn't yet available on that site, so I can't see what it actually says! Unfortunately some US registrations have been 'in process' for several years now (as of mid 2020).

A blank entry indicates that the satellite has not been registered with the UN.

- **UNPeriod** is the nodal period in minutes reported in the UN registration document, if any. Although the UN registration orbital information, reported by the state of registry, is valuable for a variety of research purposes, it is not always reliable and I recommend that users prefer the orbital data in the main object catalog which is based on US and hobbyist tracking data.
- **UNPerigee** is the orbital perigee height in km reported in the UN registration document, if any.

- 
- **UNApogee** is the orbital apogee height in km reported in the UN registration document, if any.
  - **UNInc** is the orbital inclination in degrees reported in the UN registration document, if any.

- **DispEpoch**

Disposal Epoch. Only for maneuverable payloads in Earth orbit; the epoch of the disposal orbit given in the following fields. The disposal orbit information is used to assess compliance with disposal recommendations. For objects other than maneuverable payloads, the disposal orbit is deemed to be the initial orbit. For satellites still able to maneuver, a recent orbit may be given as a placeholder.

Inclusion of the disposal orbit data is currently an experiment and the data should not be relied upon at present (2024 Oct).

- **DispPeri**

Disposal perigee; perigee of the orbit at the end of life for a maneuverable satellite.

- **DispApo**

Disposal apogee; apogee of the orbit at the end of life for a maneuverable satellite.

- **DispInc**

Disposal inclination; inclination of the orbit at the end of life for a maneuverable satellite.

- **Comment** - A descriptive comment, which I may or may not have felt moved to fill in.
